

## 8900NET Network Interface Module (Net Card)

### Key Features

- **Easy upgrade from card-edge local control to Ethernet network-based configuration, control, and monitoring**
- **Choice of user interfaces—Web-browser, Newton control panels, or third-party solutions**
- **Uses industry standard protocols including SNMP, HTTP, and TCP/IP**
- **Compatible with all Gecko and GeckoFlex frames**
- **Installs in separate card slot—leaves all 10 frame cells available for processing modules**

### Applications

- **Network-based control of GeckoFlex modules**

The 8900NET (Net Card) Network Interface module is much more than a simple Ethernet adapter—it's a complete Web server on a single module. The Web server embedded in the chipset creates Web pages for the frame and each module within it and distributes them over a standard Ethernet TCP/IP network.

For basic Web control of GeckoFlex modules, there is no need for you to purchase additional software or hardware—simply use a standard Web browser to view and control module and frame parameters. You can also use the 8900NET module in conjunction with the Newton modular control system.

### Ordering Information

#### 8900NET

Network Interface module
