

Satellite Auxiliary Control Panel Option

The Satellite Auxiliary Bus Panel provides remote control of the switcher's auxiliary buses. It connects to the switcher electronics frame via a serial control cable connected to a frame serial port. Power is supplied by an external transformer which can be switched between 120 and 230 volts ac.

Control Panel Installation

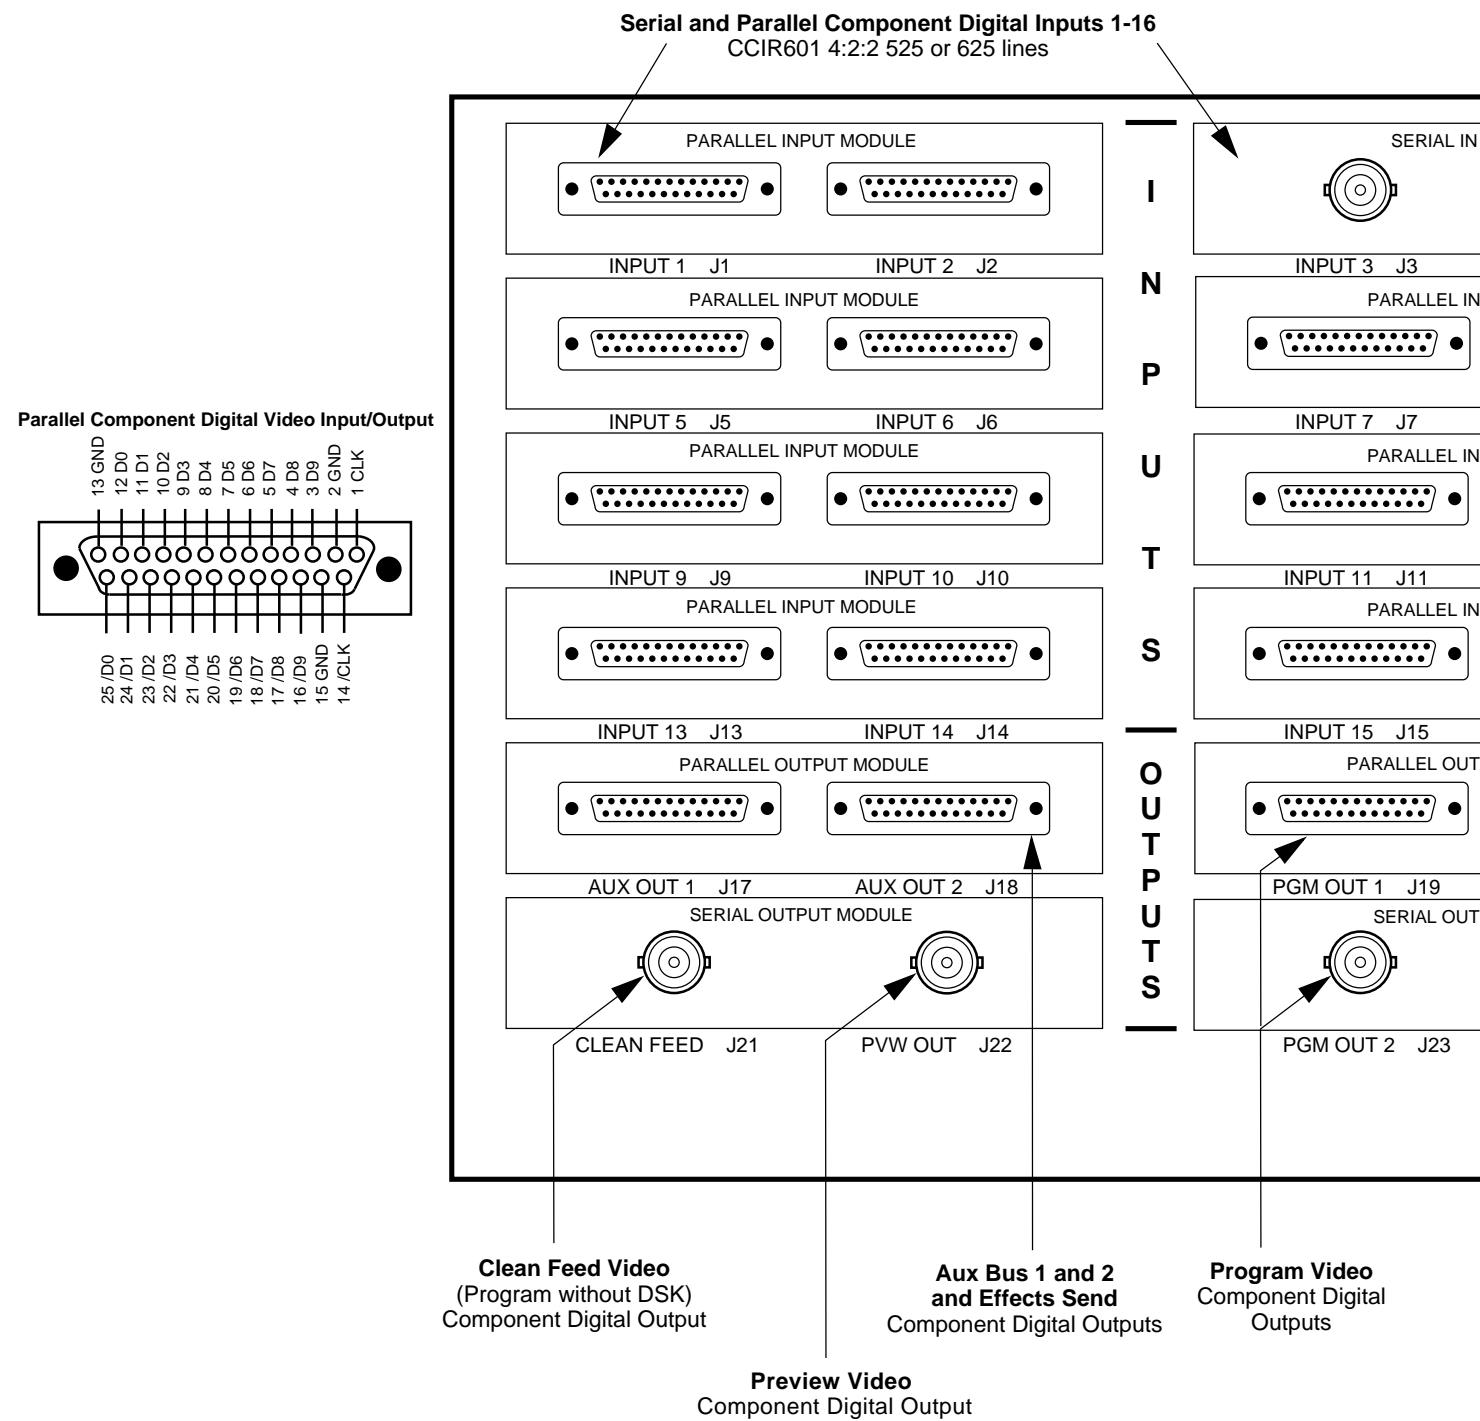

The control panel consists of a single unit which you can place on a desktop or flush mount in a console. Be sure to leave room behind the panel for making cable connections and above the panel for opening the lid.

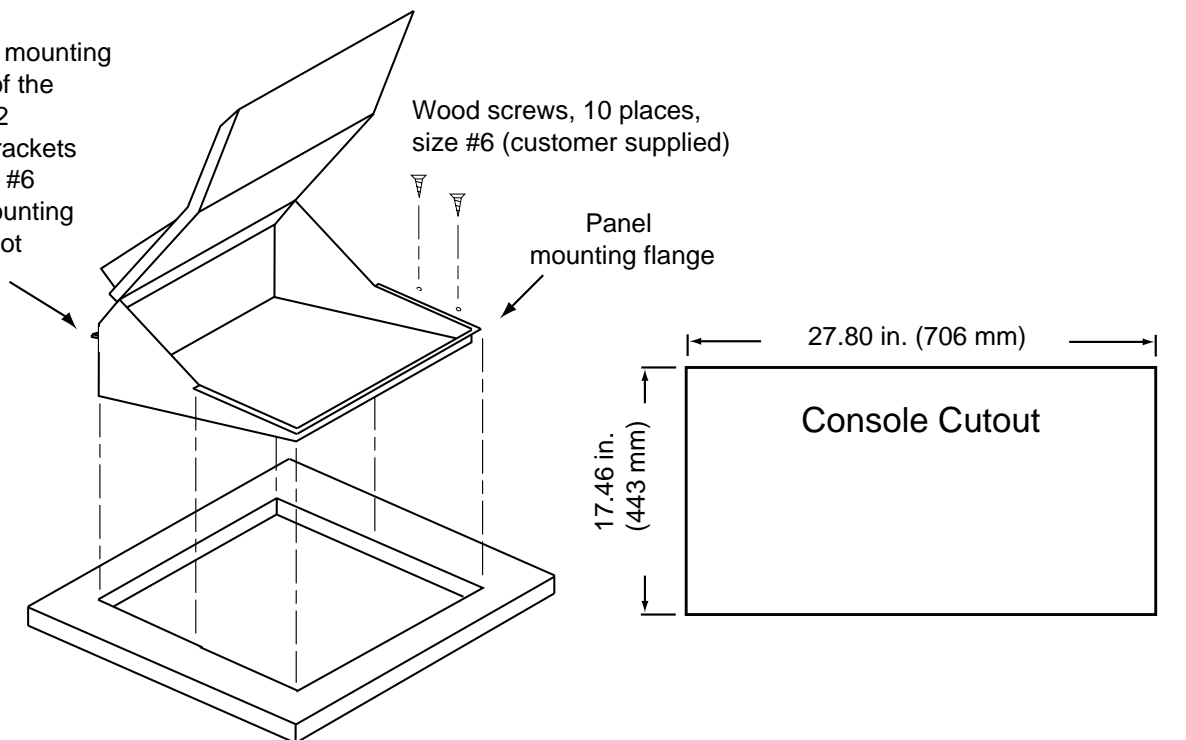

Desktop Mount

System Connections

Important: Install the mounting brackets on the rear of the panel using four #6-32 screws. Secure the brackets to the desk using four #6 wood screws. The mounting flange at the front is not capable of supporting the entire panel.

Signal Processor Frame Installation

The Signal Processor Frame mounts in a standard 19-inch wide equipment rack and requires 6 rack units of vertical space. Front and rear support are required. Leave some open space at the front of the frame for module removal, at the back of the frame for cabling, and at the sides for cooling air flow.

Typical System
