Preface

About This Manual

This manual describes the features of a specific 2000 Series module in the Kameleon Media Processing System. As part of this module family, it is subject to Safety and Regulatory Compliance described in the 2000 Series frame and power supply documentation (see the Kameleon 2000 Series Frames Instruction Manual).

Kameleon Series Multi-function Modules

Introduction

This manual contains a Quickstart guide supported by references to the complete manual and supporting documents (see [Quickstart Guide on page 12](#)). Detailed installation, power up, and configuration information follows the Quickstart Guide.

The Kameleon Series multi-function modules are for use in 2000 Series Kameleon Frames. They are designed for facilities that receive multiple feeds that need considerable audio and video processing. They are particularly well suited for broadcasters and cable facilities that need to manipulate or add audio channels to multiple program streams.

Note Kameleon operation requires 2000NET Network Interface Module hardware revision 01A1 or greater with software version 3.2.2 or greater.

Kameleon systems installed in the 2000T3N frame require the 2000FAN fan sled (refer to [Figure 7 on page 18](#)).

Kameleon offers processing modules that provide a flexible, compact system of conversion, multiplexing, timing and signal processing functions for standard definition, analog and digital, video and audio.

The Kameleon Modular Series consists of the following:

- Two versions of the front processing module are available,
 - SD – SDI video processor with SDI Video I/O and AES/EBU and/or analog audio I/O (with submodules), and
 - AV – Composite or SDI video I/O and AES/EBU or analog audio I/O (with submodules).

Standard front processing module functions include:

- 3D video decoding (KAM-AV only),
- Up to 8 channels of audio A/D or D/A conversion (with submodules),
- Video and audio synchronization,
- 8 channels of audio embedding/de-embedding,
- Audio remapping to specific I/O,
- AES/EBU sample rate conversion,
- Video and audio processing amplifiers,
- Automatic EDH insertion in SD output video,
- Video and audio test signal generators,
- Individual Analog and Digital video timing controls, and
- Powerful VBI (vertical blanking interval) processing.

Four types of rear I/O modules are available:

- KAM-AA-R Analog Audio Rear module,
- KAM-MIX-R Mixed Audio Rear module,
- KAM-AES-R AES Rear module, and
- KAM-AA-AES-UR Rear module.

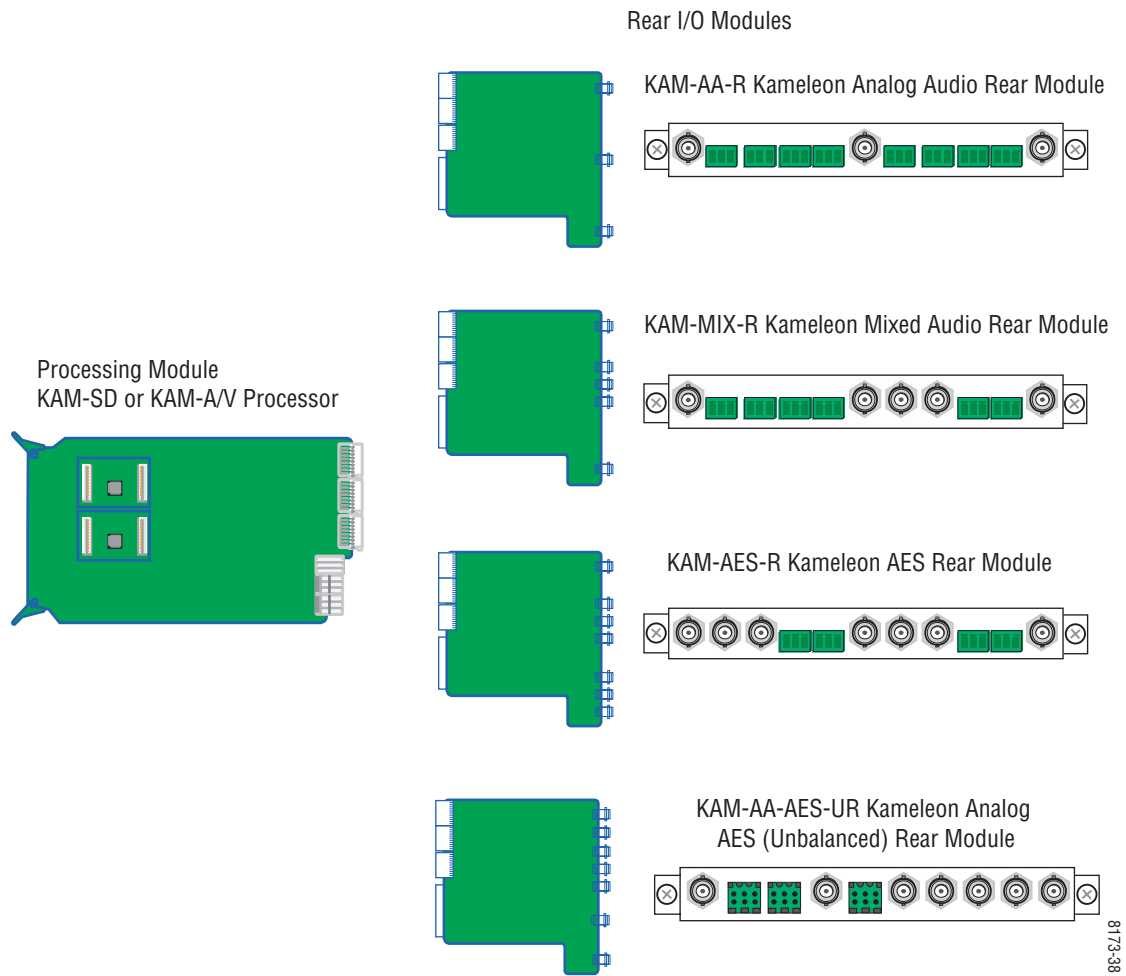

Two audio conversion submodules that can be installed on the processing module,

- Four-channel Analog to Digital Conversion Submodule (ADC), and
- Four-channel Digital to Analog Conversion Submodule (DAC).

Note Frame synchronization requires a 2000GEN Genlock Reference Module installed in the 2000 Series Kameleon Frame.

A front and rear module pair are required. The front processing modules provide the signal processing power while the rear module determines the specific I/O connections (refer to [Figure 1 on page 11](#)). Separate audio A-to-D and D-to-A converter submodules may be installed in two slots on either version of the processing module.

Figure 1. Kameleon Processing and Rear Modules

Quickstart Guide

1. Install modules in the frame.

Install the rear I/O Module. Install submodules on the front Processing Module if needed ([page 18](#)) then install the module in the frame.

2. Connect the frame to the network and navigate the web browser to the frame.

See the 2000NET Instruction Manual for information on configuring your frame IP address and connecting to the network.

3. Navigate to the module you would like to configure and click on the appropriate slot to open configuration links.

4. Navigate to I/O Configuration page to configure AES ports as:

- Inputs or outputs, and
- Balanced or unbalanced (see [page 46](#)).

Click on the **I/O Config** page link on the left side of the page. I/O Configuration also allows you to assign names for all of the module's incoming and outgoing signals. Assigning easily recognized names will help later in the configuration process.

5. Connect signal cables.

Configuration will be easier if all of the input signals are connected at this time.

6. Configure the **Video Input Select** page (see [page 63](#)).

Configure the video source and the output timing source. If you have the 2000GEN reference installed in the frame and want the Kameleon to work as a frame sync, set the output timing source to Frame Reference. If not, set the output timing source to Video In.

7. Configure the **DEMUX** (demultiplex) page (see [page 62](#)).

If you are de-multiplexing audio out of the video signal, **DEMUX** is configured next. The audio Demux page is used to extract digital audio groups from incoming SDI video for processing. These audio groups become inputs to the Audio Input Select page.

8. Configure the remaining audio/video pages.

Navigate to the **Functional View** web page (see [page 52](#) for the KAM-AV or [page 53](#) for the KAM-SD). Starting from the left, use the block diagram links to access and configure the different blocks for the desired operation by clicking on any link in a block.

9. Configure vertical blanking interval (VBI) control.

To support data carried on particular lines, the Kameleon controls certain functions within the vertical blanking interval (VBI) and on some of the active video lines.

We refer to active video lines that are used to carry data as “Data Lines”. Clicking the **Advanced (VBI Config)** radio button at the top of the **Video Input Select** page ([page 63](#)) displays the controls that allow you to specify which active video lines will be carrying data.

After making selections on this page, use the following pages for configuring the VBI/Data Lines:

- **VBI Decode** – for the composite input ([page 58](#)),
- **VBI Encode** – for the composite output ([page 79](#)), and
- **VBI SDI** – for serial digital output ([page 81](#)).

Installation

To install the Kameleon modules:

1. Place the passive rear module in a frame slot and tighten the screws on each side of the rear module,
2. Place the processor module in the corresponding front slot, and
3. Cable the signal ports.

All Kameleon modules can be inserted and removed from a 2000 Series Kameleon Frame with power on.

Note Remove the front processing module before removing the rear I/O module.

Audio submodules must be installed or removed with the processing module removed from the frame (processor module powered down).

Frame Capacity

Kameleon modules can be installed in any 2000 Series frame with a 2000NET interface.

The one rackunit 2000T1DN (with dual 130W power supplies and 2000NET module) or 2000T1DNG (with dual 130W power supplies, 2000NET and 2000GEN modules) frames have no Kameleon module capacity limitations.

The three rackunit 2000T3N (single 240W p/s, 2000FAN, and 2000NET module) and 2000T3NG (single 240W p/s, 2000FAN, 2000NET and 2000GEN modules) frames can be fully populated with Kameleon modules when the 2000FAN fan sled and two power sleds are installed.

Table 1 provides the maximum Kameleon module count for frame types.

Table 1. Power, Cooling, and Module Capacity of 2000 Series Kameleon Frames

Item	2000T3N/DNG Kameleon Frame Capacity	2000T1DN/NG Kameleon Frame Capacity
KAM-SD Module set	12	4
KAM-AV Module set	12	4

Module Placement in the Kameleon Frame

There are twelve slot locations in both the front and rear of a 3 RU frame and four slot locations in a 1 RU frame to accommodate 2000 and Kameleon Series media modules (audio/video signal handling modules).

The Kameleon media modules consist of a two-module set with a processing module and a passive rear module that can be plugged into any of the frame slot pairs. The rear modules provide the input and output interface connectors.

To install a Kameleon module set in a 2000 Series frame:

1. Locate a vacant slot in the rear of the 3 RU frame (Figure 2) or the 2000T1DNG frame (Figure 3).

Figure 2. 2000T3NG Frame, Rear View

Figure 3. 2000T1DNG Frame, Rear View

2. Insert the passive rear module into the vacant rear slot of the frame as illustrated in Figure 4.

Figure 4. Installing Passive Rear Module

3. Verify that the module connector seats properly against the midplane.
4. Using a crossblade screwdriver, tighten the two screw locks to secure the module in the frame.
5. If an ADC and/or DAC audio submodule option has been ordered, the submodule will be provided with the front processing media module.

Placement of the submodule depends on the desired audio I/O configuration from the rear module type being used. The installation of the submodule will determine the functionality of the input and output audio connectors on each side of the rear module.

As illustrated in Figure 5 on page 17, Submodule 1 is wired to the connectors on the left side of the rear module. Submodule 2 is wired to the right side connectors.

Figure 5. Submodule/Rear Connector Relationship

Refer to the rear module cabling information tables for correct placement of the submodules to match your requirements as follows:

- KAM-AA-R – designed for eight-channel analog audio I/O (see [Table 2 on page 21](#)),
- KAM-MIX-R – designed for mixed I/O of two AES/EBU streams (balanced or unbalanced) and four analog audio channels, (see [Table 3 on page 22](#)),
- KAM-AES-R – designed for eight AES/EBU audio, balanced or unbalanced I/O connections (see [Table 4 on page 24](#)). No submodules are used with this application, and
- KAM-AA-AES-UR – designed for mixed I/O of three dual balanced analog audio inputs or outputs (six channels) and four BNC audio connections for four streams of AES audio inputs, outputs, or two inputs and two outputs (see [Table 5 on page 24](#)),

If the submodule(s) needs to be installed, refer to [Figure 4 on page 16](#) for the location of the submodule depending on the application.

To install a submodule, line up the connectors on the bottom of the submodule with the correct submodule position on the top of the media module circuit board (Figure 6). Press firmly to seat the submodule.

After power-up, installation status of the submodule will be reported on the Status web page as described in *Status Web Page* on page 41.

Figure 6. Kameleon Submodule Installation

6. Locate the corresponding front media slot (1 -12) in the 3 RU frame frame (Figure 7) or front media (slot 1-4) the 1 RU frame (Figure 8 on page 19).

Figure 7. 2000T3NG Kameleon Frame, Front Slots

Figure 8. 2000T1DNG Kameleon Frame Front Slots

7. With the component side up, insert the front processing module in the corresponding front slot (see [Figure 9](#)).
8. Verify that the module connector seats properly against the midplane and rear module connector.
9. Press firmly on both ejector tabs to seat the module.

Figure 9. Installing Front Media Module

Cabling

All cabling is done at the corresponding rear module. Four different rear modules are available for various audio and video I/O configurations.

Note The newer KAM-AA-AES-UR model is referred to as an extended rear module because it uses different firmware and has dual analog audio connectors.

All modules accept SDI video in and provide SDI video out. Composite video inputs and outputs are only available with the KAM-AV front module.

Analog audio functions require the use of the audio ADC (analog to digital) and DAC (digital to analog) conversion submodules installed on the front module. Use of the submodules depends on the type of rear module and the audio requirements as described in each rear module cabling section.

[Figure 5 on page 17](#) illustrates the relationship of submodule to rear connector for KAM rear modules. AES audio input or output configuration is set by configuring the connector as an input or output on the I/O Config web page ([Figure 25 on page 49](#)).

Cabling for each type of rear module is illustrated in the figures listed below:

- KAM-AA-R – see [Figure 10 on page 21](#),
- KAM-MIX-R – see [Figure 11 on page 22](#),
- KAM-AES-R – see [Figure 12 on page 23](#), and
- KAM-AA-AES-UR – see [Figure 13 on page 25](#).

Specific signal names are assigned for each connector using the 2000 GUI using the **I/O Config** web page (see [Configuration and Adjustments on page 29](#)).

KAM-AA-R Configurations

The KAM-AA-R rear I/O module (Figure 10) accepts either SDI or composite video (KAM-AV only). Three video BNC connectors are provided—one each for video in, composite video out (KAM-AV only), and SDI video out. Eight three-terminal audio connectors are provided for analog audio input or output I/O as determined by placement of the audio conversion submodules.

Figure 10. KAM-AA-R Input/Output Connectors

Table 2 provides the various audio input and output I/O configurations based on the positioning of the audio ADC and DAC submodules and the available video outputs. Figure 5 on page 17 illustrates the relationship of submodule to rear connector for KAM rear modules. Submodule installation is shown in Figure 6 on page 18.

Table 2. KAM-AA-R I/O Configurations

Submodule 1	Submodule 2	Video Input	Audio Inputs	Audio Outputs	Video Output
A to D	A to D	1 SDI or Composite ¹ (J11)	8 analog	None	1 SDI (J1) and 1 Composite ¹ (J6)
D to A	D to A		Demux from SDI input	8 analog	
A to D	D to A		4 analog	4 analog	

¹ Only KAM-AV modules support composite video I/O.

KAM-MIX-R Configurations

The KAM-MIX-R rear I/O module (Figure 11) accepts either SDI or composite video (KAM-AV only). Five BNC connectors are provided—three for video and two for unbalanced AES/EBU I/O. Six three-terminal audio connectors are provided—four for analog audio I/O and two for analog or balanced AES/EBU I/O.

Figure 11. KAM-MIX-R Input/Output Connectors

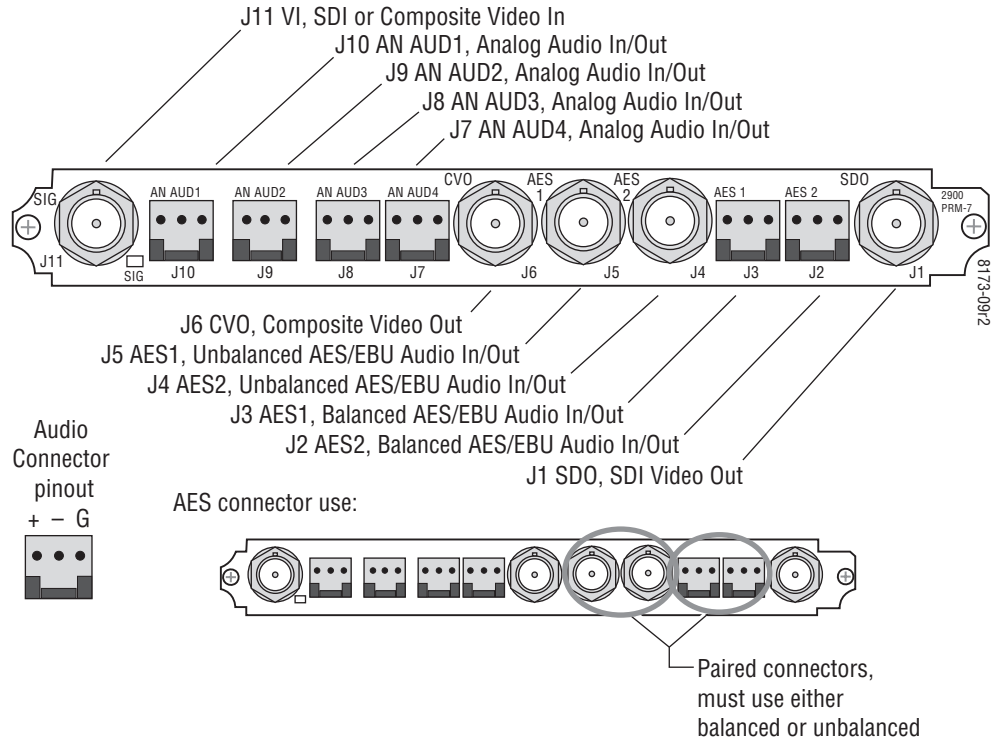

Table 3 provides the various audio input and output I/O configurations based on the positioning of the audio ADC and DAC submodules in Position 1 only and the available video outputs. Figure 5 on page 17 illustrates the relationship of submodule to rear connector for KAM rear modules. Submodule installation is shown in Figure 6 on page 18.

Table 3. KAM-MIX-R I/O Configurations

Submodule 1	Submodule 2	Video Input	Audio Inputs	Audio Outputs	Video Output
A to D	None	1 SDI or Composite ¹ (J11)	4 analog, 2 AES/EBU balanced or unbalanced	None	1 SDI (J1) and 1 Composite ¹ (J6)
D to A	None		2 AES/EBU balanced or unbalanced	4 analog	
A to D	None		4 analog	2 AES/EBU balanced or unbalanced	
D to A	None		None	4 analog, 2 AES/EBU balanced or unbalanced	

¹ Only KAM-AV modules support composite video I/O.

KAM-AES-R Configurations

The KAM-AES-R rear I/O module accepts either SDI or composite video (KAM-AV only). Seven BNC connectors are provided—three for video and four for unbalanced AES/EBU I/O. Four three-terminal audio connectors are provided for AES/EBU balanced audio I/O. AES/EBU connectors are configured in pairs as shown in Figure 12.

Figure 12. KAM-AES-R Input/Output Connectors

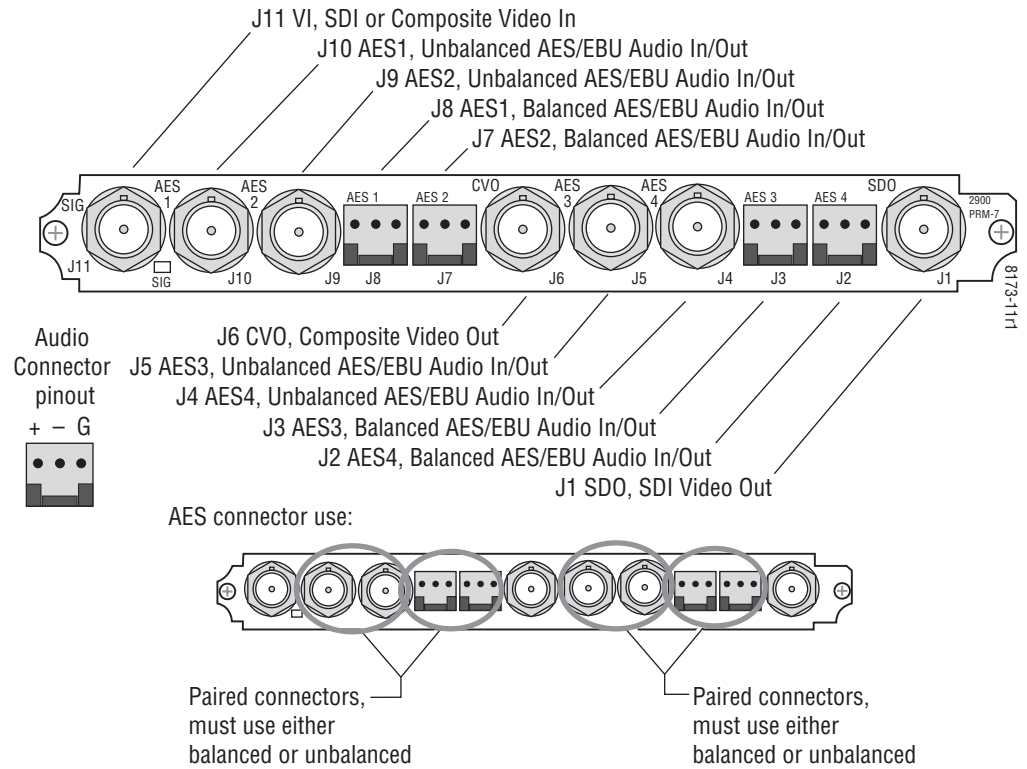

Table 4 provides the various audio input and output I/O configurations and the available video outputs. Submodules are not used in these configurations.

Table 4. KAM-AES-R I/O Configurations

Submodule1	Submodule 2	Video Input	Audio Inputs	Audio Outputs	Video Output
None	None	1 SDI or Composite ¹ (J11)	4 balanced or unbalanced AES/EBU	None	1 SDI (J1 ¹) and 1 Composite ¹ (J6)
None	None		None	4 balanced or unbalanced AES/EBU	
None	None		2 balanced or unbalanced AES/EBU	2 balanced or unbalanced AES/EBU	

¹ Only KAM-AV modules support composite video I/O.

Table 5 lists the active and inactive connections for the KAM-AES-R module when the Balanced or Unbalanced mode is selected.

Note Only the selected AES outputs are valid. Unconfigured AES outputs are invalid and should not be used.

Table 5. KAM-AES-R AES/EBU Connector Selections

Channel Pair	Mode	Active Connectors	Inactive Connectors
AES 1 & AES 2	Unbalanced	J10 and J9	J8 and J7
AES 1 & AES 2	Balanced	J8 and J7	J10 and J9
AES 3 & AES 4	Unbalanced	J5 and J4	J3 and J2
AES 3 & AES 4	Balanced	J3 and J2	J5 and J4

KAM-AA-AES-UR Configurations

The KAM-AA-AES-UR rear I/O module (Figure 13) accepts either SDI or composite video (KAM-AV only). Three BNC connectors are provided for video—one video input, one composite output (KAM-AV only), and one SDI video output. Three dual terminal audio connectors are provided for analog audio input or output I/O. Four BNCs are provided for unbalanced input or output AES I/O.

Figure 13. KAM-AA-AES-UR Input/Output Connectors

Table 6 provides the various audio input and output I/O configurations and the video outputs. Analog audio input or output configuration depends on the positioning of the audio ADC and DAC submodules.

Any number of audio inputs can be configured but there is a limit of four audio output pairs with any configuration.

Table 6. KAM-AA-AES-UR I/O Configurations

Submodule 1	Submodule 2	Video Input	Analog Audio Inputs/Outputs ¹	AES Audio Inputs/Outputs ¹	Video Output
A to D	A to D	1 SDI or Composite ² (J10)	3 dual analog inputs (J6 ³ , J8, and J9)	4 AES/EBU unbalanced BNCs J2-J5 selectable as all inputs, all outputs, or 2 inputs and 2 outputs. on I/O Config web page	1 SDI (J1) and 1 Composite ² (J6)
A to D	D to A		2 dual analog inputs (J8 and J9) and 1 dual analog output (J6 ³)		
A to D	None		2 dual analog inputs (J8 and J9)		
None	A to D		1 dual analog input (J6 ³)		
D to A	D to A		3 dual analog outputs (J6 ³ , J8, and J9)		
D to A	A to D		2 dual analog outputs (J8 and J9) and 1 dual analog input (J6 ³)		
D to A	None		2 dual analog outputs (J8 and j9)		
None	D to A		1 dual analog output (J6 ³)		
None	None		None		

¹ There may be any number of audio inputs but there is a limit of four output audio streams with any configuration.

² Only KAM-AV modules support composite video I/O.

³ Analog Audio connector J6 supports only Analog Audio Channels 1 and 2.

Power Up

The front LED indicators are illustrated in [Figure 14](#).

Figure 14. Front and Rear Module Indicator LEDs

A green Signal Present LED can be seen on the Passive Rear Module (PRM) on all model types when a valid input signal is present.

Operation Indicator LEDs

Table 7 provides a complete list of possible operating conditions and the resulting indicator status.

A red FAULT LED indicates an error situation. Table 7 describes signal output and LED indications for the various input/reference combinations and user settings.

Table 7. Indicator LEDs and Conditions Indicated

LED	Indication	Condition
Fault (red)	Off	Normal operation
	On continuously	Module has detected internal fault
	Long flash	One of the inputs is missing or is wrong standard
	Short flash	Errors present in SDI and/or AES/EBU input
COMM (yellow)	Off	No activity on frame communication bus
	Three flash/off pattern	Module Location command received from a remote control system
	Short flash	Activity present on the frame communication bus
CONF (yellow)	Off	Module is in normal operating mode
	Three flash/off pattern	Module Location command received from a remote control system
	On continuously	Module is initializing, changing operating modes or updating firmware. (When solid on along with Fault LED on, board has failed to load data.)
PWR (green)	Off	No power to module or module's DC/DC converter failed
	On continuously	Normal operation, module is powered

Note The yellow **COMM** and **CONF** LEDs are used for the module location function that is enabled using the 2000NET GUI. The module location function causes these LEDs to repeatedly flash concurrently three times followed by an off state of 900 ms duration (see [Slot Configuration Web Page on page 106](#)).

Configuration and Adjustments

KAM-AV/SD configuration and monitoring can be performed using a web browser GUI interface or a networked Newton Control Panel. This section provides an overview of each of these controls along with the configuration parameters available with each type of control device.

Configuration Summary

The configuration parameters and monitoring functions available with the web browser interface and the Newton Control Panel are summarized in [Table 8](#). The parameter defaults, choices, ranges, and resolution are provided for each function

Table 8. Summary of KAM-AV/SD Configuration Controls

Function	Default	Range/Choices Resolution	Web Page/ Function Name	Newton Panel	Module/ Submodule
Composite video in	100%	44 to 219.5% (0.5% steps)	Composite In/ Input Video Gain%	IVidGain	KAM-AV only
Black level	0%	-21.6 to 22.4% (0.1% steps)	Composite In/ Black Level%	BlackLVL	
Input signal setup (525 only)	Setup	No Setup or Setup	Composite In/ Input Signal Setup No Setup or Setup radio button	N/A	
3D motion type	Mixed Motion	Low Motion Mixed Motion High Motion	Composite In/ 3D Decoder Control Low Motion, Mixed Motion or High Motion radio button	N/A	
3D motion threshold	Low – 60 Mixed – 25 High – 5	0 to 127 (1 unit steps)	Composite In/ 3D Decoder Control 3D Motion Threshold	MotThrlD	
3D Comb filter	Luma + Chroma	Luma + Chroma Luma Chroma	Composite In/ 3D Decoder Control Comb Filter pulldown	decmodel	
3D Luma bandwidth	Low – Wide Mixed – Wide High – Narrow	Narrow or Wide	Composite In/ 3D Decoder Control Luma Bandwidth Narrow or Wide radio button	LumaBw	
3D Luma level	56	0 to 255 (1 unit steps)	Composite In/ 3D Decoder Control Luma Level control	YLevel	
3D Chroma level	56	0 to 255 (1 unit steps)	Composite In/ 3D Decoder Control Chroma Level control	CLevel	
3D Decoder reset to default	Mixed Motion Defaults	–	Composite In/ 3D Decoder Control Reset 3D Decoder to Default button	N/A	
Blank VBI lines (Field 1 and Field 2)	Pass Through	Blanking, Notch Decode, Pass Through, and Remove setup (525 mode)	VBI Decode/ VBI Line radio buttons	N/A	KAM-AV/SD

Table 8. Summary of KAM-AV/SD Configuration Controls

Function	Default	Range/Choices Resolution	Web Page/ Function Name	Newton Panel	Module/ Submodule
SDI In web page view selection	Summary	Summary or Detail	SDI In/ Summary or Detail radio button	N/A	KAM-AV/SD
Set error reporting for SDI input video	Enabled	Enabled or Disabled	SDI In/Detail View/ Check or uncheck error checkboxes	N/A

¹ This control is valid only for a 525 line rate signal but will still appear in the Newton controls when a 625 line rate is selected. This control is not valid for 625 and should not be used.

Newton Control Panel Configuration

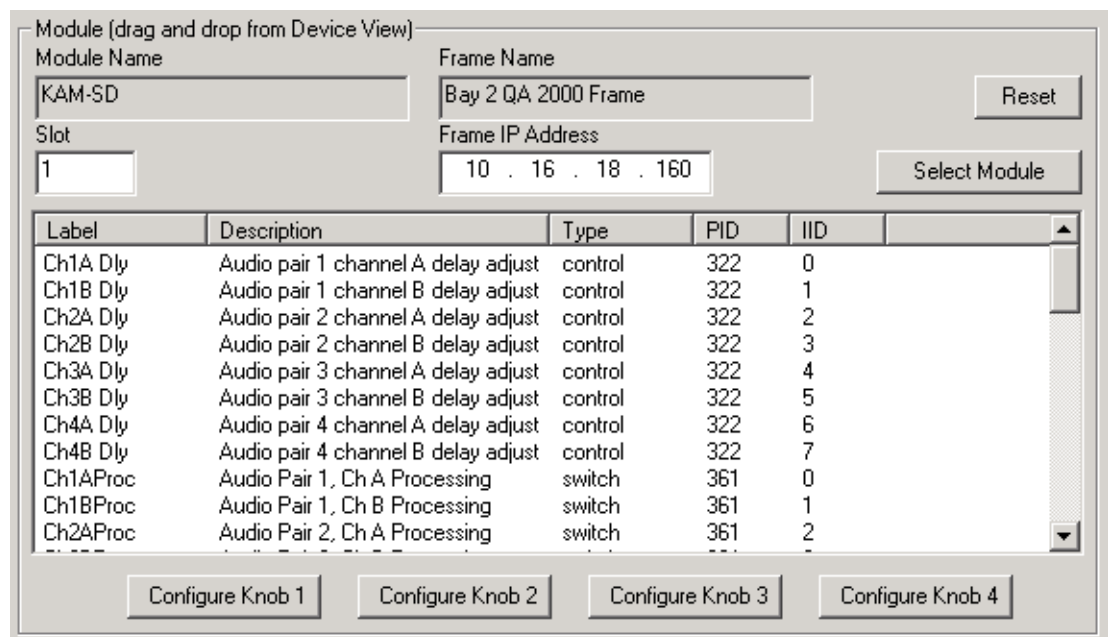

A Newton Control Panel (hard or soft version) can be interfaced to the Kameleon 2000 Series frame over the local network. Control panel access offers the following considerations for module configuration and monitoring:

- Ability to separate system level tasks from operation ones, minimizing the potential for on-air mistakes.
- Ability to group modular products—regardless of their physical locations—into logical groups (channels) that you can easily manipulate with user-configured knobs.
- Update software for applicable modules and assign frame and panel IP addresses with the NetConfig Networking application.
- Recommended for real-time control of module configuration parameters, providing the fastest response time.

Note Not all module functions are available with the control panel, such as E-MEM and factory default recalls. The available control panel controls for the module are listed in [Table 8 on page 29](#).

An example of the Newton Configurator is shown in [Figure 15](#).

Figure 15. Newton Configurator Example

Refer to the documentation that accompanies the Newton Modular Control System for installation, configuration, and operation information.

Web Browser Interface

The web browser interface provides a graphical representation of module configuration and monitoring.

Use of the web interface offers the following considerations:

- Provides complete access to all module status and configuration functions, including naming of inputs and outputs, factory parameter and name default recalls, E-MEM functions, slot configuration, and SNMP monitoring controls.
- Web access will require some normal network time delays for processing of information.
- Configuration parameter changes may require pressing the **Apply** button or **Enter**, upload processing time, and a manual screen refresh to become effective.
- Web interface recommended for setting up module signal and slot names, E-MEMS, and reporting status for SNMP and monitoring.

Refer to the Frame Status page shown in [Figure 16 on page 37](#). The Kameleon and 2000 modules can be addressed by clicking either on a specific module icon in the frame status display or on a module name or slot number in the link list on the left.

Note The physical appearance of the menu displays on the web pages shown in this manual represent the use of a particular platform, browser and version of 2000NET module software. They are provided for reference only. Displays will differ depending on the type of platform and browser you are using and the version of the 2000NET software installed in your system. This manual reflects 2000NET software version 3.2.2.

Figure 16. 2000NET GUI

The Links section lists the frame and its current modules. The selected link's Status page is first displayed and the sub-list of links for the selection is opened. The sub-list allows you to select a particular information page for the selected device.

Content display section displays the information page for the selected frame or module (frame slot icons are also active links).

Web Page Operations and Functional Elements

The following conventions and functional elements (shown at left) are used in Kameleon web page operations. (The examples shown throughout this manual represent 2000NET software version 3.2.2 or later):

- Pull-down menus allow you to choose selections from a list.
 - Check boxes are used when a selection can be enabled or included in a group. Multiple check box selections or enables can be made for some parameters.
 - Radio buttons are used to make a choice of one parameter in a group.
 - Each numerical adjustment control has a **Coarse** adjust button (left and right top double arrows) and a **Fine** adjust button (left and right bottom single arrows).
- To change a value, use the arrow button controls or enter a value into the number field and select the **Apply** button. You may also enter a number into the number field from a keyboard and hit the **Enter** key to apply the value.
- A **Refresh** button (circular arrow) is provided for manual refresh of the web page to view recently changed parameters.
 - The Status LED is explained below.

Status and Identification Header

Each Kameleon configuration page has a Status and Identification Header as shown in Figure 17.

Figure 17. Typical Status/ID Header

Status LED icon

The Status LED icon reports communication status for the frame slot and is a link to the module Status page where Warnings and Faults are displayed. LED colors indicate:

- Green = Pass – no problems detected
- Yellow = Configuration error warning
- Red = Fault condition detected

Variables:

- Model and Description are read-only generated by the module.
- Frame Location is entered in 2000 Series Kameleon Frame configuration.
- Slot number reports the module's location in the frame.

Initial Configuration Process Overview

To configure the Kameleon module proceed as follows:

1. Go to the **I/O Config** page to setup and name inputs and outputs.
2. If not already connected, connect all input and output signals. Go to the module **Status** page to verify component and signal presence and condition.
3. Go to the **Video Input Select** page to configure the video source (not required for KAM-SD) and output timing source.
4. Go to **DEMUX** if you are demultiplexing audio from the video signal.
5. Go to the **Functional Views** page to:
 - Verify the module's functional configuration is correct, and
 - Begin with the Input block links to configure each function in turn.

Note **Next** links are provided to help you navigate through a logical configuration sequence.

6. Use **E-MEM** memory to store or recall configurations as necessary.

KAM-AV and KAM-SD Links and Web Pages

The 2000 GUI provides the following links and web pages for the KAM-SD and the KAM-AV modules (Figure 18):

- Status, I/O Config, and Functional View web pages showing
 - Module operation status,
 - Rear module I/O configuration.
 - Functional block diagram showing active/inactive functional blocks and providing links to the related web pages,
- Module Configuration web pages for setting up the module,
- E-MEM configuration storage and recall web page, and
- Slot Configuration, SNMP, and software update web pages.

Logical subject links are also available on each configuration web page.

Note Some listed links may not appear when the Kameleon hardware configuration does not support that function. (For example, when no DAC submodule is installed, Analog Audio Output links will not appear.) When this occurs, the Functional View web page will indicate the related block is inactive (see Figure 27 on page 52 for the KAM-AV module and Figure 28 on page 53 for the KAM-SD module).

2 KAM-AV
[Status](#)
[I/O Config](#)
[Functional View](#)
 - [Composite In](#)
 - [VBI Decode](#)
 - [SDI In](#)
 - [DEMUX](#)
 - [Video Input Select](#)

The Status web page for the KAM-AV (Figure 19 on page 42), KAM-SD module (Figure 20 on page 43), and KAM-AV or SD with extended rear modules (Figure 21 on page 44), provide an overall indication of the health of the system and links to web pages for the active components:

- Status Header – the same on all Kameleon configuration pages (see *Web Page Operations and Functional Elements* on page 38),
- Color-coded communication status for each component and path,
- Summary of all fault/warning conditions, and
- Textual module status, front module, and submodule properties.

Color-coded Status Indicators and Links

Each box on the Status page represents a Kameleon module or submodule as shown for example in Figure 19 on page 42. Arrows represent signal paths that may or may not be monitored. These elements act as links when their function is active (indicated by underlined function name).

Color code:

- Green = Pass – operating as expected.
- Yellow = Warning – signal is absent, has errors, or is misconfigured.
- Red = Fault – a component has failed.
- Grey = Not monitored.
- White = Not present.

Status/Front Module Properties

The Status/Front Module properties in the footer provide a textual summary of the color-coded module status. Front module properties provide hardware, firmware (different between the KAM-AV and KAM-SD and KAM-AV or SD modules using an extended rear module), software identification, and asset tag number for the KAM-SD or KAM-AV front processing module. ADC or DAC submodule properties are also reported if they are installed on the processing module.

Submodule Properties

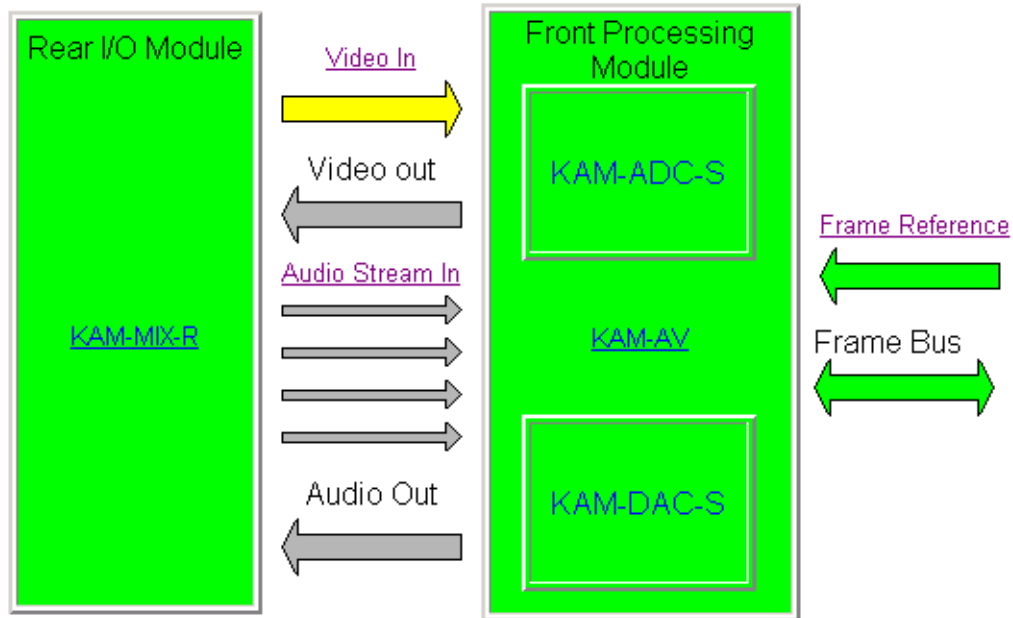

The Submodule properties in the footer provide a textual summary of the color-coded submodule status. If the front module has the ADC or DAC submodule installed, the bottom of the Status web page will display part number, serial number, and hardware revision for each submodule.

Warning/Fault Summary

The warnings and faults shown below are reported in the summary section of the Status web page (Figure 19 on page 42). A **Fault** indicates a serious condition that prohibits proper operation. A **Warning** indicates a condition which may or may not adversely affect operating conditions, but should be noted. Warnings may possibly be corrected by changing configuration, settings or input signals.

Warnings

- WARNING - Rear Module is not connected
- WARNING - Wrong Rear Module (incompatible with Kameleon)
- WARNING - Wrong Rear Module (no communication)
- WARNING - Wrong Rear Module (unknown type, incompatible)
- WARNING - Video Input is 625 and reference is 525 lines
- WARNING - Video Input is 525 and reference is 625 lines
- WARNING - Video Input is 625 but configuration is 525 lines
- WARNING - Video Input is 525 but configuration is 625 lines
- WARNING - Video Input Signal not detected
- WARNING - Frame Reference is not present
- WARNING - Frame Reference is not locked to input
- WARNING - Frame Reference is not present
- WARNING - No Video output - GenLock selected but not present
- WARNING - 1 or more Audio Input signals not detected
- WARNING - 1 or more Audio Input signals have had AES stream errors
- Internal Error - Unknown submodule type

Faults

- FAULT - nnV power supply bad. (nn = variable: 24 V, 12.5 V, 5 V, 3.3 V, 1.5 V, -5 V, or -12.5 V)
- FAULT - A/D failed (A /D system measuring power supplies and bus levels)
- FAULT - Xilinx 1 failure (main video processor)
- FAULT - Xilinx 2 failure (main audio processor)
- FAULT - MFM (Multi-function module) EEPROM checksum fails
- FAULT - DS1803 not responding (digital video in adjustment)
- Internal Error - Unknown front module type

Use the I/O Config web page to:

- Assign easily recognized signal names that will help later in the configuration process, and
- Configure AES audio ports as inputs or outputs, balanced or unbalanced.

Figure 23 illustrates the KAM-AA-R Rear module I/O Config web page. The type of submodule in Position 1 will determine whether Analog Audio connectors J7-J10 are all inputs or all outputs. The type of submodule in Position 2 will determine whether Analog Audio connectors J2-J5 are all inputs or all outputs.

Refer to Table 2 on page 21 for submodule I/O combinations and Figure 10 on page 21 for cabling information.

Figure 23 illustrates the KAM-MIX-R Rear module I/O Config web page. The type of submodule in Position 1 will determine whether Analog Audio connectors J7-J10 are all inputs or all outputs. Submodule 2 is not used with this rear module.

Select the type of AES I/O with the **Unbalanced** or **Balanced** radio buttons. The selected AES connectors can be defined as inputs or outputs with the pull-down controls on this web page.

Refer to Table 3 on page 22 for submodule I/O combinations and Figure 11 on page 22 for cabling information.

Note Only the selected AES outputs are valid. Unconfigured AES outputs are invalid and should not be used.

Figure 24 illustrates the KAM-AES-R Rear module I/O Config web page. Select the type of AES I/O with the two sets of **Unbalanced** or **Balanced** radio buttons. The selected AES connectors can be defined as inputs or outputs with the pulldown controls.

Refer to Table 4 on page 24 for submodule I/O combinations and Figure 12 on page 23 for cabling information.

Note Only the selected AES outputs are valid. Unconfigured AES outputs are invalid and should not be used.

Figure 25 illustrates the KAM-AA-AES-UR Rear module I/O Config web page. The type of submodule in Position 1 will determine whether Analog Audio connectors J8 and J9 are inputs or outputs. The submodule in Position 2 will determine whether Analog Audio connector J6 is an input or an output.

AES unbalanced connectors J2, J3, J4 and J5 can be defined as all inputs, all outputs, or 2 inputs and 2 outputs with the pulldown controls on this I/O web page.

Note If the KAM-AA-AES-UR Rear module is installed in a frame with a 2000NET card running version 3.2.2 software, the dual Analog Audio graphics will be shown as boxes with red X's. The dual audio graphic is not recognized by this version 2000NET card. Functionality is not affected.

Refer to Table 6 on page 26 for submodule I/O combinations and Figure 13 on page 25 for cabling information.

I/O Config Page Elements

Four of the AES-Rear module audio connectors are shown in [Figure 26](#) to illustrate the function of each row of the diagram.

Header Row

The top header row provides the connector hardware physical label (J#) and the dedicated signal type for the connector. This information is determined by the type of rear module and front processor module installed (refer to the [Functional View Web Page](#) on page 52).

Figure 26. Balanced/Unbalanced AES/EBU Inputs

Connectors

The Connector row illustrates connector type provided (BNC or 3-pin terminal) for each port. Connector type and input/output possibilities vary according to the rear I/O module used or with the presence of ADC or DAC submodules.

Input/Output Mode

I/O mode is either static read-only or an operational Input/Output selection (determined by the rear module used).

Signal Name

Enter a signal name (up to 15 characters) for each operational input/output. The name will be used to identify the signal in other configuration pages.

Status

Table 9 shows, by color and signal type, the signal status reports that may be displayed in the Status row:

Table 9. I/O Config Status Report Messages

Color	Video In	Analog Audio In	Analog Audio Out	Digital Audio In	Digital Audio Out	Video Out
Green	Present	Present	None	Present	None	None
Yellow	Not present or 525/625 mismatch	None	None	Not present	None	None
Light Grey	None	Silent/Unused	Not Monitored	None	Not Monitored	Not Monitored
Medium Grey	None	Not Available	None	Not Available	Not Available	None
Dark Grey	None	None	None	None	None	Unused

 - [Video Input Select](#)

Use the Functional View web page (KAM-AV – Figure 27, KAM-SD – Figure 28 on page 53) to:

- Monitor module functions and signal paths, and
- Navigate to pages for configuring active functions.

The Functional View page is a block diagram of the installed Kameleon system that reports the module functions and signal paths that are active or inactive in the current configuration. It can be used as a link map for configuring module functions. Begin configuring with one of the input function blocks on the left.

Color coding indicates active functions and flow. Greyed components are inactive due to hardware and/or software constraints. Underlined module functions are links to the page for that function. Return links and logical next step links are provided at the bottom of each configuration page.

Use
this
link

Use the Composite In web page ([Figure 29 on page 57](#)) to set parameters for a composite video input (if present) on the KAM-AV module as listed below:

- Adjust input signal gain and black level,
- Select input signal format for 525 line mode (NTSC),
- Include or omit black level Setup for 525 line mode, and
- Select the type of 3D decoding required for the application and adjust 3D Decoder parameters.

Video Input Status

The Input Status section is read-only. The Input Signal name is the one assigned on the [Input/Output Configuration Web Page on page 46](#). Input Standard can be affected by settings on the 2000GEN module (if present) and the [Video Input Select Web Page on page 63](#).

Settings for Standard 525/625

The Composite input signal may be adjusted as required before decoding by using the controls on this page. 625 line rate settings do not require and do not show Video Input Signal Option or Input Signal Setup.

Note The PAL-M standard is not supported for 3D decoding.

Input Video Gain

Input Video signal gain can be adjusted approximately ± 6 dB.

Black Level

Black level can be adjusted $\pm 20\%$ of peak black-to-white amplitude. With a video input at nominal level, 1% equals 7 mV in PAL-B and 0.93 IRE in NTSC.

Input Signal Setup

For 525 line rate, if the composite input to the module includes setup, click on the **Setup** radio button. The setup will be removed from the video signal as part of the conversion process.

Note When setup is selected, artifacts or spikes are sometimes detected at the start or end of the active picture due to the positioning of the start of setup. These can be minimized by adjusting the clipping controls on the Video Proc web page, then applying the clips to the VBI/Data Lines.

3D Decoder Control

The composite input is processed through a 3D decoder which offers three preset decoder modes and a user defined mode. Preset modes are selected according to the amount of motion present in the input video.

Each decoder mode has a set of default values when selected. User controls are provided for setting motion threshold, the type of comb filtering, luma and chroma threshold levels, and luma bandwidth.

To determine the best preset decoding mode for your application, select one of the 3D preset decoding modes at the bottom of the 3D Decoder Control section depending on the amount of motion in the input video:

- **Low Motion** – this is a 3D temporal filter ideal for applications where there is little motion in the video, such as scenes involving sitting and other scenes involving little motion.
- **Mixed Motion** – a general purpose filter, this is the default choice for most video applications involving mixed motion.
- **High Motion** – a 2D adaptive filter is employed for handling change in motion recommended for video where there will be a great deal of motion such as sports. Once motion is detected in a scene, the high motion decoder should be used.
- **User Defined** – changing any preset value in the Motion decoders will switch to the user mode.

After setting the preset decoder mode for the amount of motion in the video application, use the following controls to maximize video quality.

3D Motion Threshold

This control sets the limit between the use of 3D or 2D adaptive decoding modes. 3D decoding is used below the motion threshold, otherwise the mode is 2D adaptive decoding. This decoding mode decision is automatically evaluated for each pixel.

As a general rule to get the best decoding result, it is recommended to reduce the motion threshold as the motion increases in the video. Use the default threshold values of each preset decoder as a guide to setting the 3D motion threshold and the correct preset decoder mode.

The preset modes and default thresholds are as follows:

- **High Motion** preset set the threshold to 5,
- **Mixed Motion** preset sets the threshold to 25, and
- **Low Motion** preset sets the threshold to 60.

The recommended mode is **Mixed Motion** which is the factory default mode.

Comb Filter

The comb filter is part of the 2D adaptive comb filter mode. It determines what component of the video will be used to detect motion (Luma and Chroma or just the Luma or Chroma portion of the video).

- **Luma + Chroma** – when set for both luminance and chrominance, the 2D adaptive decoder motion detector is controlled by both the luminance and chrominance difference level magnitude.
- **Luma** – in this mode, the 2D adaptive decoder motion selector is controlled by only the luminance difference level magnitude in the video.
- **Chroma** – in this mode, the 2D adaptive decoder motion selector is controlled by only the chrominance difference level magnitude in the video.

Luma Level

The Luma Level control sets the magnitude of the difference level threshold for the Y or luminance component of the video signal in the comb filter. The default value is 56.

Chroma Level

The Chroma Level control sets the magnitude of the difference level threshold for the chrominance portion of the video signal in the comb filter. The default value is 56.

Luma Bandwidth

The Luma Bandwidth sets the frequency at which the comb filtering occurs. It can be set for **Narrow** or **Wide**.

- **Narrow** – extends the 2D comb filter to lower frequencies and is the default bandwidth for the **High Motion** preset mode.
- **Wide** – allows 2D comb filtering only at higher frequencies. This is the **Mixed** and **Low Motion** default.

Note Narrow or Wide bandwidth may be selected according to the chrominance subcarrier frequency and chrominance bandwidth.

Reset 3D Decoder

Press the **Reset 3D Decoder to Default** to return to the default **Mixed Motion** mode with the defaults listed in [Table 8 on page 29](#).

VBI Decode Web Page for Composite Input

- [2 KAM-AV](#)
- [Status](#)
- [I/O Config](#)
- [Functional View](#)
- [Composite In](#)
- [VBI Decode](#)
- [SDI In](#)
- [DEMUX](#)
- [Video Input Select](#)

Use this link

Use the VBI decode web page (Figure 30 for 525, Figure 31 on page 59 for 625) to configure the VBI and Data Line decoding of the composite input signal (KAM-AV only).

The currently detected line rate will be reported. Use the View Selection to view the page at the correct line rate with the **525** or **625** radio button.

On a line-by-line basis you can remove black level setup (in NTSC video) and select one of the following three decoding options:

- Blank existing VBI and Data Line information,
- Select Notch Decoding of the composite signal, or
- Pass through decoded VBI and Data Lines (active video lines) information as is.

Note The data lines not reserved for carrying data on the previous page will appear greyed out.

Use the DEMUX (demultiplex) web page to extract AES/EBU audio groups that are present in the incoming SDI video. These audio groups become inputs on the Audio Input Select web page (Figure 62 on page 93) and any pair can be routed to one of the four audio processing paths. The two extracted groups also remain in the SDI video signal. To delete groups from the SDI signal, go to the *MUX Web Page* on page 74.

In Figure 34, two groups (G1 and G2) have been extracted from the SDI input providing four two-channel audio streams for input into the Audio Input Select stage. Any two of Groups G1-G4 may be extracted.

Figure 34. Demultiplexing Capacity

Use the DEMUX web page to demultiplex the desired streams (Figure 35).

Video Input Select Web Page

Use
this
link

- [SDI In](#)
- [DEMUX](#)
- [Video Input Select](#)
- [Frame Sync](#)
- [Video Proc](#)
- [MUX](#)
- [VBI Encode](#)
- [VBI SDI](#)

Use the Video Input Select web page (Figure 36 on page 65) to:

- Configure input video type and line rate,
- Enable or disable Loss of Signal reporting to the Status page and SNMP monitoring (refer to the 2000NET manual for SNMP information),
- Configure Vertical Blanking Interval (in Advanced mode), and
- Select the output timing reference.

View Setting

In the View Selection display, choose the **Standard** radio button to display the standard settings shown in Figure 36 on page 65. Use the **Advanced** view for configuring the Vertical Blanking Interval for selecting active video lines to carry data (see *Advanced VBI Configuration* on page 66).

Video Selection Settings

The following functions are provided in the Video Selection section:

- Input Name – (read-only) signal name is entered on the **I/O Config** page
- Input Status –
 - Signal presence reported
 - Enable/disable Loss of Signal report to both Kameleon status pages and SNMP monitoring devices.

Note The disabling of video and reference Loss of Signal reports and SDI Input Error warnings allow you to filter these reports from higher level Kameleon status displays and SNMP monitoring. They will still be reported on this page.

- Video Format –
 - Current input video format reported.
 - Choose between SDI and Composite video format or select Automatic signal format detection.
- Video Line Rate – select 525 or 625 line rate or enable automatic line rate detection.
- Flywheel Video Decoder – use of the Flywheel Video Decoder is recommended when working with noisy input signals, such as satellite feeds. Once the optimum input signal has been acquired, turn the Flywheel Video Decoder off during normal operation.

For best results, turn the Flywheel Video Decoder on by selecting the **On** checkbox and set the Output Timing Selection source to **Video In**. Locate the optimum video input signal, then turn the flywheel off (uncheck).

When the Flywheel Video Decoder is turned on, a caution will appear as shown in [Figure 36 on page 65](#). Since the Flywheel decoder generates its own video timing for the incoming video stream to deal with noise and interruptions, leaving it on during normal operation may cause undesirable re synchronization delays if the source changes or is lost. It will take about 7 seconds to change states.

- Frame Reference –
 - 2000GEN frame reference signal presence reported,
 - Enable/disable Loss of Signal report to both Kameleon status pages and SNMP monitoring devices.
- SDI Input Errors – displayed only for SDI input (SDI or Auto)
 - Input signal errors reported.
 - Enable/disable SDI error warning report to both Kameleon status pages and SNMP monitoring devices.
- Frame Sync/Delay – (read-only) Frame Sync mode is reported when Output Timing Selection is **Internal Frame Reference** and timing is provided from the 2000GEN module. Delay mode is reported when the input signal (**Video In**) is used for timing reference

Output Timing Selection

If you have a 2000GEN reference module installed in the frame and want the Kameleon to work as a frame synchronizer, set the output timing source to **Internal Frame Reference**. Otherwise, set the output timing source to **Video In**.

Note For correct composite out color framing in PAL-B, always use the Internal Frame Reference.

Note When a video input with embedded audio is switched, the audio will mute when the module is set to Delay mode (Video In reference). To avoid any audio muting, use the Internal Frame reference (Frame Sync).

[Back \(DEMUX\)](#)

Advanced VBI Configuration

Advanced VBI configuration allows you extend VBI into the active picture range for special data insertion requirements. Active video lines that are used to carry data are referred to as Data Lines.

To add Data Lines to VBI:

1. Choose **Advanced (VBI Config)** on the Video Input Select web page (Figure 37).

Figure 37. Standard and Advanced View Selection

Video Input Select

Model: [KAM-AV](#) Description: [Kameleon Module](#)

Frame Location: [Bay 1 QA 2000 Frame](#) , Slot: [2](#)

Last Recalled E-MEM: [Factory Defaults](#)

View Selection:	<input type="radio"/> Standard	<input checked="" type="radio"/> Advanced (VBI Config)
-----------------	--------------------------------	--

The **VBI/Data Lines** panel will appear at the bottom of the web page (see [Figure 38 on page 67](#) for 525 line rate and [Figure 39 on page 67](#) for 625 line rate).

2. Select the last line (includes all previous active video lines) that will be used for data.

Selected active video lines will be shown in the **Reserved for Data** section of the web page as shown for lines 21/284 and 22/285 in [Figure 38 on page 67](#) and lines 24/337 and 25/338 in [Figure 39 on page 67](#).

Active video lines that can be made available for data insertion are:

- For 525, lines 21 – 24 in Field 1, lines 284 – 287 in Field 2
- For 625, lines 24 – 28 in Field 1, lines 337 – 341 in Field 2

Frame Sync Web Page

- Use this link
- [SDI In](#)
 - [DEMUX](#)
 - [Video Input Select](#)
 - [Frame Sync](#)
 - [Video Proc](#)
 - [MUX](#)
 - [VBI Encode](#)

Use the Frame Sync web page to:

- Adjust horizontal and vertical timing, and
- Freeze the current output or, if using a 2000GEN reference signal, select an automatic freeze mode for output when the signal is lost.

Timing Adjustment

Table 10 shows the ranges of timing for 525 and 625 signal formats.

Table 10. Timing Adjustment Ranges

Line Rate	Max Horizontal Adjustment	Max Vertical Adjustment
525/NTSC	857.5 pixels	524 lines
625/PAL	863.5 pixels	624 lines

Freeze Mode Selection

The Freeze mode controls available depend on the output timing reference selected on the [Video Input Select Web Page](#) on page 63.

Frame Sync mode (using the 2000GEN **Internal Frame Reference** output timing reference) provides the manual activation selections plus **AutoBlack** and **AutoFreeze** modes to be used when the video signal is lost ([Figure 40 on page 69](#)). AutoBlack outputs a black signal while AutoFreeze outputs the last complete video field.

When set to Frame Delay mode (using the **Video In** output timing reference), Freeze Mode allows you to manually freeze the output using **Field 1**, **Field 2**, or one **Frame** ([Figure 41 on page 69](#)). A field freeze provides less resolution and no motion artifacts in the output. In Frame mode the resolution is higher since both fields are present, but the presentation of two fields can cause motion artifacts.

Figure 40. Frame Synchronizer Web Page – Internal Frame Reference

Video Processing Web Page

- Use
this
link
- [SDI In](#)
 - [DEMUX](#)
 - [Video Input Select](#)
 - [Frame Sync](#)
 - [Video Proc](#)
 - [MUX](#)
 - [VBI Encode](#)
 - [VBI SDI](#)

Use the Video Processing page ([Figure 42 on page 71](#)) to:

- Enable/disable Standard or Advanced video processing,
- Turn on Color Bars test signal,
- Enable/disable video gain lock,
- Adjust component video gain (Y, B-Y, R-Y),
- Adjust component video DC Offset (Y, B-Y, R-Y),
- Enable/disable soft and hard clipping controls, and
- Apply selected clip settings to VBI/Data lines.

Video Processing Controls

Video Processing Enable

To bypass Video Processing on the SDI signal select **Disable** ([Figure 42 on page 71](#)). To make video processing adjustments to the SDI signal select **Enable** or select **Color Bars** to use the internally generated 100% vertical color bars test signal.

Two modes of video processing are available, Standard or Advanced. With **Standard** selected, only the Y Channel Video Processing controls on the left will be visible along with the clipping controls.

When **Advanced** is selected, the B-Y and R-Y Gain and Balance/Offset controls will also be displayed as shown in [Figure 43 on page 73](#).

Standard View

In Standard View ([Figure 42 on page 71](#)), adjust the following for the Y Channel:

- Contrast/Y Gain – adjust the percentage of luminance relative to white (50 to 149.6%).
- Saturation/Chroma Gain – adjust the percentage of saturation and chroma gain relative to 100% saturation (50 to 149.6%).
- Brightness/Y Offset – adjust the amount of brightness/Y offset in mV (-3.55 to 3.44%)
- Hue/Chroma Phase – for 525 signals only, adjust the hue/chroma phase in degrees (-89.8 to 89.8 degrees).

Figure 42. Video Processing Web Page

 **Video Proc**

Reset to Default

[Back](#) [Functional View](#) [Next \(MUX\)](#)
[Next \(VBI Encode\)](#)

Clipping Controls

Clipping controls are provided that affect the luminance (soft/Y) and overall saturation (hard/video) levels of the output signal.

Refer to [Figure 42 on page 71](#). To enable the clip controls select the **Enable** radio button. You may also apply the clip levels to the vertical blanking interval by checking the **Apply Clips to VBI/Data Lines** box. This control is also available on the VBI SDI web page ([page 81](#)).

Use the following clipping controls to adjust levels on the video output:

- Use the **Soft/Y White Clip** control to set the clipping level for the top end (white) of the luminance signal (positive excursions).
- Use the **Soft/Y Black Clip** control to set the clipping level for the bottom end (black) of the luminance signal (negative spikes and Super Black).
- Use the **Hard/Video White Clip** control to set the clipping level for the top end (white) of the overall video signal (clips white and reduces overall saturation level to fit within clip).
- Use the **Hard/Video Black Clip** control to set the clipping level for the bottom end (black) of the overall video signal (clips black and reduces overall saturation level to fit within clip).

Advanced View

In Advanced View ([Figure 43 on page 73](#)), adjust the following for the B-Y and R-Y Channels:

Note To adjust gain for all channels simultaneously, set **Video Gain Lock to On**. This locks Y, B-Y, and R-Y adjustments together. Adjustment of one gain setting changes all gain values (Y, B-Y, R-Y) the same amount.

- B-Y/R-Y Gain – adjust the percentage of B-Y and R-Y gain relative to 100% (50 to 149.6%).
- B-Y/R-Y Balance/Offset – adjust the amount of B-Y and R-Y DC offset in mV (-3.55 to 3.44%)

Reset To Default

Select the **Reset To Default** button on the bottom of the screen to return all values to the factory defaults.

Reset to Default

[Back](#) [Functional View](#) [Next \(MUX\)](#)
[Next \(VBI Encode\)](#)

MUX Web Page

- Use this link
- [DEMUX](#)
 - [Video Input Select](#)
 - [Frame Sync](#)
 - [Video Proc](#)
 - [MUX](#)
 - [VBI Encode](#)
 - [VBI SDI](#)
 - [Composite Out](#)

Use the MUX (multiplex) web page to:

- Delete unwanted audio groups from the SDI input video signal or clear all horizontal ancillary data (HANC), and
- Insert or replace audio groups into the SDI video stream that have been selected on the Audio Input Select web page, paired on the Audio Channel Pairing web page and configured in the Audio Proc, Audio Sync, and Audio Delay web pages.

Note The audio channel pairs available to each Mux Group below are determined by the Audio Channel Pairing web page (see [page 94](#)).

Note The Kameleon multiplexing circuit assumes there are no gaps between Groups in the input SDI video signal. If there are gaps, and one or more groups are inserted or replaced, all input Groups after the gap will be removed.

The MUX web page provides two functions: Group Deletion and Group Replacement.

Group Deletion

The Group Deletion area of the MUX web page reports if an embedded audio signal is present in any of the four possible audio groups in the incoming SDI signal and the output status of each group. It is the same as the Status reporting on the DEMUX web page ([Figure 35 on page 62](#)). It can be used to delete unwanted embedded audio groups or clear all HANC (horizontal ancillary data) in the SDI video input signal if present.

Composite Video Input

When composite video is selected as the input to the module (no embedded audio is possible), the MUX web page Group Deletion section will appear as shown in [Figure 44](#) with the **Delete** and **No Input HANC data to clear** greyed out.

Figure 44. Composite Video Input

Group Deletion

	Group 1	Group 2	Group 3	Group 4
Input Status	Not Present	Not Present	Not Present	Not Present
Delete	N/A	N/A	N/A	N/A
Output Status	Inserted	Inserted	Empty	Empty
No input HANC data to clear				

No Embedded Audio

If no embedded audio groups are present in the incoming SDI signal, the Group Deletion input status section will appear as shown in Figure 45. Input Status is **Not Present** and Output Status is **Empty** for each audio group. No deletion or Group Replacement is possible with this status.

Figure 45. No Embedded Audio Present

Group Deletion

	Group 1	Group 2	Group 3	Group 4
Input Status	Not Present	Not Present	Not Present	Not Present
Delete	<input type="checkbox"/> Delete	<input type="checkbox"/> Delete	<input type="checkbox"/> Delete	<input type="checkbox"/> Delete
Output Status	Empty	Empty	Empty	Empty
<input type="checkbox"/> Clear all input HANC data				

Pass and Delete Embedded Audio

If an embedded audio group is present in the incoming SDI signal and has been selected for **No Extraction** on the DEMUX web page, the audio group will be passed to the output as shown in Figure 46. Input Status is **Present** and Output Status is **Passed**.

Audio groups present in the incoming SDI stream may also be deleted. Check the corresponding **Delete** checkbox to remove an audio group completely that is reported as **Present** from the SDI stream. The Output Status will report **Deleted**.

Figure 46. Pass and Delete Embedded Audio

Group Deletion

	Group 1	Group 2	Group 3	Group 4
Input Status	Present	Present	Not Present	Not Present
Delete	<input type="checkbox"/> Delete	<input checked="" type="checkbox"/> Delete	<input type="checkbox"/> Delete	<input type="checkbox"/> Delete
Output Status	Passed	Deleted	Empty	Empty
<input type="checkbox"/> Clear all input HANC data				

Clear All HANC Data

All horizontal ancillary data can be cleared from the SDI input signal by selecting the **Clear all HANC data** checkbox. The Output Status will then show all present groups as being deleted (Figure 47).

Figure 47. Clear All HANC Data from SDI Video

Group Deletion

	Group 1	Group 2	Group 3	Group 4
Input Status	Present	Present	Not Present	Not Present
Delete	N/A	N/A	N/A	N/A
Output Status	Deleted	Deleted	Empty	Empty
<input checked="" type="checkbox"/> Clear all input HANC data				

24-Bit Audio Warning

The warning “24 Bit Audio in all four groups may exceed data space capabilities” may appear under the Group Deletion section when any of the following conditions occur:

- SDI Video In,
- 525 line video format,
- 24 bit audio format for Mux Group A, or
- 24 bit audio format for Mux Group B.

An example of this is shown in Figure 48.

Figure 48. 24 Bit Audio Warning

Group Deletion

	Group 1	Group 2	Group 3	Group 4
Input Status	Present	Present	Present	Present
Delete	<input type="checkbox"/> Delete	<input type="checkbox"/> Delete	<input type="checkbox"/> Delete	<input type="checkbox"/> Delete
Output Status	Passed	Passed	Passed	Passed
<input type="checkbox"/> Clear all input HANC data				
 24 Bit Audio in all four groups may exceed data space capabilities				

Group Replacement

Mux groups A and B can replace existing audio groups in the SDI stream and/or be inserted into an empty group space with the Group Replacement function (Figure 50 on page 78). Mux Group A and Mux Group B are configured using the inputs to the Audio Input Select web page (page 91) then the Audio Channel pairing web page (page 94). Two Mux groups can be multiplexed (embedded) into the SDI output stream.

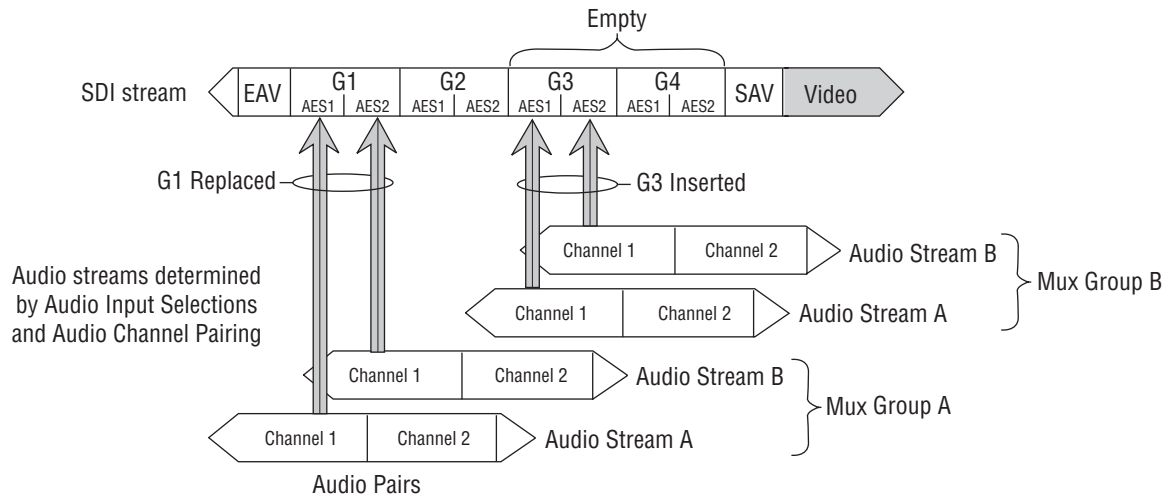

A multiplexing example of replacing and inserting audio is shown in Figure 50 on page 78. In this case, Audio Group 1, present in the incoming SDI video stream, has been replaced with Mux Group A by selecting the **Stream A** and **Stream B** checkboxes and the **Group 1** radio button in the Group column.

Mux Group B has been inserted into empty Audio Group 3, not present in the incoming SDI video stream, by selecting the **Stream A** and **Stream B** checkboxes and the **Group 3** radio button in the Group column.

The Sample rate (**20** or **24 Bits**) can be set for each Mux group before embedding.

Figure 49 depicts an example of the multiplexing of the selected audio Mux groups into the SDI video stream based on the selections made on the Mux web page in Figure 50 on page 78.

Figure 49. Multiplexing into the SDI Stream

One audio Group = two streams (A & B) max.
One stream = two channels (1 & 2) max.

[Back \(Audio\)](#)

VBI Encode Web Page for Composite Output

- Use this link
- [DEMUX](#)
 - [Video Input Select](#)
 - [Frame Sync](#)
 - [Video Proc](#)
 - [MUX](#)
 - [VBI Encode](#)
 - [VBI SDI](#)
 - [Composite Out](#)

Use the VBI Encode web page (Figure 51 for 525, Figure 52 on page 80 for 625 line rate) to configure the VBI and Data Line encoding for the composite output signal (KAM-AV module only).

The currently detected line rate will be reported. Use the View Selection to view the web page at the correct line rate with the **525** or **625** radio button.

This web page allows you to do the following on a line-by-line basis:

- Blank existing VBI and Data Line information
- Remove black level setup (in 525 line rate only)

You may also apply the clipping done in the Video Processor to all VBI lines by checking the **Apply Clips to VBI/Data Lines** checkbox.

Note The data lines not reserved for carrying data on the Video Input Select web page will appear greyed out. See *Advanced VBI Configuration* on page 66.

- [Composite Out](#)
- [SDI Out](#)
- [Analog Audio Inputs](#)
- [AES Inputs](#)

Use the Composite Out web page (Figure 55) to adjust the following components of the video composite output signal (KAM-AV module only):

- Signal setup,
- Cross Color removal,
- Chrominance signal,
- Burst signal, and
- Gain, and Fine and Coarse delay.

Figure 55. KAM-AV Video Composite Out Web Page

Composite Out

Model: [KAM-AV](#) Description: [Kameleon Module](#)

Frame Location: [Bay 1 QA 2000 Frame](#) , Slot: 2

Last Recalled E-MEM: [Factory Defaults](#)

Output Signal Name	Comp Out
Video Output Standard:	525

Output Video Gain (%) <input type="text" value="100.0"/> <input type="button" value="Apply"/>	

[Back](#) [Functional View](#)

Signal Setup

For 525 standard composite, select **Setup** to add setup to the output or **No Setup** to not add it to the composite output.

Cross Color Removal

Enable Cross Color Removal filtering for a composite signal that displays unwanted luminance and chrominance artifacts produced during encoding of the signal.

Chrominance Removal

Enable Chrominance Removal to completely remove the chrominance portion of the composite output signal.

Burst Removal

Enable Burst Removal to completely remove the burst portion of the composite output signal.

Output Video Adjustments

Gain and coarse/fine delay of the composite output signal can be set to calibrated values by selecting the **Calibrated** button. The delay settings are independent of the Frame Sync and SDI Video output controls.

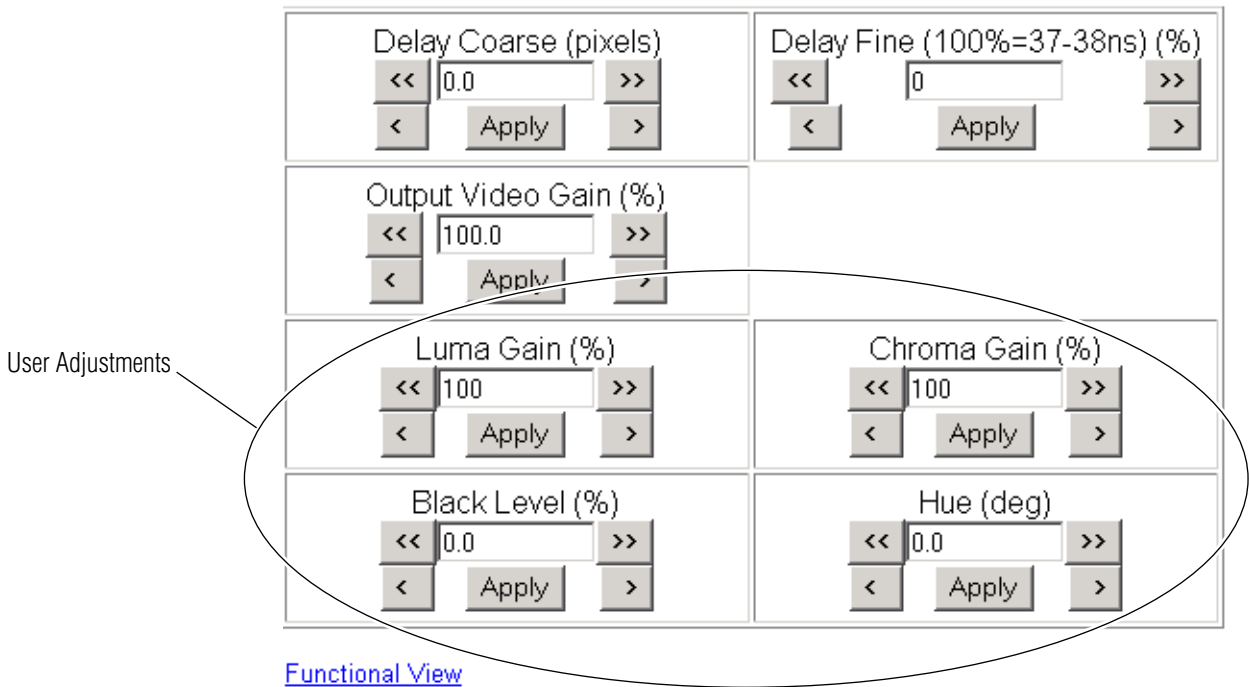

If **User Adjustable** is selected use the following controls to adjust the composite output:

- **Delay Coarse** – adjusts the output delay in coarse steps of 5 pixels (double arrows) or 0.5 pixels (single arrows). The coarse delay range is from 0–4095 pixels.
- **Delay Fine** – adjusts the percent of output delay in fine steps of 10 percent (double arrows) or 1.0 percent (single arrows). The fine delay range is from 0–100% (100% = 37-38 ns)
- **Output Video Gain** – adjusts the output video gain in steps of 5 percent (double arrows) or 0.5 percent (single arrows). The output gain range is approximately 61–138.5 percent.

When the **User Adjustable** radio button is selected the following controls are also made available for adjustment of the composite output (Figure 56):

- Luma Gain – adjust percentage of luma (brightness) relative to 100%.
- Chroma Gain – adjust the percentage of color saturation relative to 100%.
- Black Level – adjust the percentage of black level relative to 0%.
- Hue – (control appears in 525 only) adjust the hue of the output signal in degrees.

The Analog Audio Inputs web page is present when a KAM-ADC sub-module is installed on the front media module in position 1 or position 2. Analog audio inputs are available from a KAM-AA-R, KAM-MIX-R, or KAM-AA-AES-UR rear module.

Use the Analog Audio Inputs web page (Figure 58 for KAM-AA-R and KAM-MIX-R) to view the signal present and clipping status of the analog audio inputs and set maximum input levels. The web page for an extended rear module (with dual analog audio inputs) such as a KAM-AA-AES-UR, is shown in Figure 59 on page 88.

These audio groups become inputs on the Audio Input Select web page (Figure 62 on page 93) and any pair can be routed to one of the four audio processing paths.

Figure 58. Analog Audio Inputs Web Page

Analog Audio Inputs

	AA In Ch4	Max Input Level (dBu) << 24.0 >> < Apply >	Signal Present	Not Clipping

Input

The Input column will indicate which rear module connectors are being used to input the analog audio. Refer to the [Input/Output Configuration Web Page](#) on page 46 for how to configure the analog audio input connectors.

Name

The Name column will report the default input name for these audio connectors or the name given to the inputs by the user.

Maximum Input Level

The maximum input level is adjustable -2.0 to +28 dBu. Kameleon uses this value to adjust the signal level into the A-to-D converter for the best signal-to-noise and dynamic range.

Signal Present

A Signal Present status will be reported if the incoming signal is greater than -40 dBFS.

Clipping

Clipping will be reported when incoming signals are in excess of approximately 0.5 dB of maximum level.

AES Inputs Web Page

 - [AES Inputs](#)
 - [Audio Input Select](#)
 - [Audio Channel Pairing](#)

Use the AES Inputs web page (Figure 60) to check AES/EBU input signal status decoded from the input signal status bits.

These audio groups become inputs on the Audio Input Select web page (Figure 62 on page 93) and any pair can be routed to one of the four audio processing paths.

Figure 60. AES/EBU Audio Inputs Web Page

Model: [KAM-AV](#) Description: [Kameleon Module](#)
 Frame Location: [Bay 1 QA 2000 Frame](#) , Slot: 2
 Last Recalled E-MEM: [Factory Defaults](#)

AES Input characteristics

Input	Name	Signal State	Sample Rate	Mode	Ch1 Emphasis	Ch2 Emphasis	Ch1 Data	Ch2 Data	AES Errors Detected	
J10	AES In 1 Unbal	Present	48 kHz	---	Off	Off	Audio	Audio	Errors Detected	<input type="button" value="Clear"/>
J9	AES In 2 Unbal	Present	48 kHz	---	Off	Off	Audio	Audio	Errors Detected	<input type="button" value="Clear"/>

[Functional View](#) [Next](#)

Input

The Input column will indicate which rear module connectors are being used to input AES audio depending on the type of rear module installed. Refer to the [Input/Output Configuration Web Page](#) on page 46 for how to configure the AES input connectors.

Name

The Name column will report the default input name for these audio connectors or the name given to the inputs by the user.

Signal State

The signal state of the AES audio will be reported as **Present** or **Not Present**.

Sample Rate

Kameleon accepts AES/EBU input signals at sample rates from 31 kHz to 96 kHz. The currently detected sample rate will be reported.

Mode

All Kameleon audio processing is done in 24-bit mode. 20-bit input signals are converted to 24-bits using dithering probability. 20- or 24-bit output mode is selectable on later pages for AES/EBU and multiplexed (SDI) outputs.

Emphasis

Ch1 and Ch2 Emphasis windows report whether high frequency emphasis is present (On/Off) on the audio input signal. Emphasis is high frequency gain adjustment that can conform to 50/15 μ s or CCIT J.17 standards.

Data

The Ch1 and Ch2 Data windows report whether the input channels contain standard AES/EBU Audio or Data.

AES Errors Detected

Use the **Clear** button to refresh the AES Errors Detected in the AES Errors Detected column.

Audio Input Select Web Page

- Use this link
- [VBI SDI](#)
 - [Composite Out](#)
 - [SDI Out](#)
 - [Analog Audio Inputs](#)
 - [AES Inputs](#)
 - [Audio Input Select](#)
 - [Audio Channel Pairing](#)
 - [Audio Sync](#)

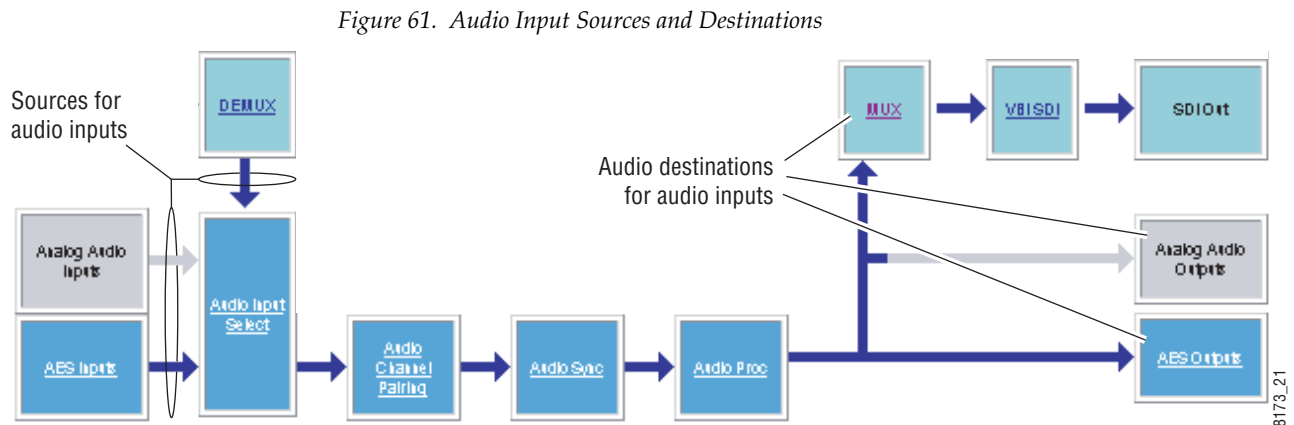

Use the Audio Input Select web page to select and format the four audio streams for downstream processing and output. The Audio Input Select web page is shown in [Figure 62 on page 93](#).

The Audio Input Select web page provides the following functions:

- Selects the source assignment for each audio stream with the radio button in each stream column.
- Enable or disables sample rate conversion for each stream,
- Enable or disables Loss of Signal reporting for each stream.
- Enable or disables AES error reporting for each AES stream.

All available audio inputs from the DEMUX, Analog Audio Inputs, and AES Inputs web pages are fed to the Audio Input Select page. From the available inputs, configure up to four audio streams for processing and output. **Silence** may also be selected for any stream.

[Figure 61](#) illustrates the possible audio sources and destinations for the configured streams.

Refer to [Figure 62 on page 93](#) for the following explanations.

Input Stream Select

All available audio inputs are listed on the Audio Input Select web page with the names defined on the I/O Config web page. For this example, module default names are used.

Select the desired Stream 1-4 by selecting the corresponding radio button for that input.

Status

The status of each of the selected inputs is reported as **Present** or **Not Present**.

Sample Rate Convert

On demultiplexed and AES audio inputs, select whether to disable sample rate conversion on each stream. This does not apply to analog audio inputs.

Loss of Signal Reporting

Enable or disable loss of signal reporting for each stream to higher levels such as SNMP reporting. This does not apply to analog audio inputs.

Reporting

The Reporting row will display what status is being reported to the higher levels. When Reporting is unchecked, the display will report **Not Monitored**.

AES Errors

Enable or disable AES error reporting to higher levels. This is not applicable for analog or demultiplexed digital audio signals.

The Audio Channel Pairing web page (Figure 63) allows the input audio channels to be arbitrarily recombined into new pairs, streams, and groups. The rows represent the audio input channels and the columns represent the audio output channels. The columns are grouped together into four different pairs.

The recombined audio pairs can be routed as follows:

- Any output pair can be routed to any of the AES/EBU output streams of the module (see [AES Outputs Web Page on page 100](#)).
- Any output pair can be routed to an analog output pair (see [Analog Audio Outputs Web Page on page 98](#)).
- Either or both Multiplexing Groups can be inserted into the SDI output video (see [MUX Web Page on page 74](#)).

Note Audio input names are assigned using the **I/O Config** page. Factory default names are used here.

- [AES Inputs](#)
- [Audio Input Select](#)
- [Audio Channel Pairing](#)
- [Audio Sync](#)
- [Audio Proc](#)
- [Analog Audio Outputs](#)
- [AES Outputs](#)

Use the Audio Proc web page ([Figure 65 on page 97](#)) to adjust the following for Audio Pair 1 & 2 and Audio Pair 3 & 4:

- Adjust audio signal gain for each channel or the two audio pairs,
- Lock gain settings for simultaneous channel A/channel B adjustment,
- Select a processing option for each channel.

Use the Pair Selection radio buttons to select either Pairs 1 & 2 or Pairs 3 & 4 for adjustment.

Audio Gain

Each audio channel can be adjusted for gain separately or in pairs. Use the following adjustments for audio gain:

- To lock the two channels in a pair together, select the Gain Settings **Locked** checkbox for Pair 1 and/or Pair 2.
- Adjust the gain (-40 to +6 dB) for each channel with the Ch A Gain Adjust and Ch B Gain adjust controls for each pair. If the pair is locked, adjusting either control will set the gain to the same value for each channel in the pair.

Note After gain has been adjusted, a straight quote mark (') will be added to Ch A' and Ch B' to indicate the status of the channels after gain.

Output Processing

Set the output processing for each channel with the Processing pulldown to one of the following:

- Pass
- Invert
- A+B
- A-B
- -(A+B)
- 1 kHz (test tone)
- 400 Hz (test tone)
- Silence
- A + B (Pair 1, Pair 2, Pair 3 or Pair 4)

The Presence and Clipping status of each audio channel is reported as **True** or **False** in the read-only displays. If the audio is > -40 dBFS, it will be reported as **True**. If clipping is < 0.5 dBFS, it will be reported as **False** as shown in [Figure 65 on page 97](#).

Selecting Output Resolution

Select the AES output resolution for Pair 1, Pair 2, Pair 3, and Pair 4 with the **20 bit** or **24 bit** radio button.

Use this link

The E-MEM web page provides local operations for learning and recalling configurations into five E-MEM registers. File operations are also available for saving or loading the learned E-MEM files to and from a hard disk or other accessible media.

Factory default settings for all channels can be recalled by selecting the **Recall factory settings** button. To return the module to the factory signal names (such as the signal inputs), select the **Recall factory names** button.

There are two E-MEM view selections: **Standard** and **Advanced**.

In Standard view (Figure 69), any one of five learned E-MEMs can be recalled by selecting the corresponding **Recall** button in the Local Operations window. This will place the configuration for the entire module into that E-MEM into the KAM-SD-2AES-DMX. This change will occur immediately upon recall. The name of the last recalled E-MEM will appear in the top header of each web page for the module.

To learn an E-MEM select the **Advanced** button in the View Selection section. This will open the Advanced view (Figure 70 on page 102).

Figure 69. E-MEM Web Page (Standard View)

Restore factory settings

Restore factory names

The Advanced View (Figure 70) includes a File Operations section to Learn a configuration into E-MEM (**Learn**), save a file to a disk location (**Save to...**) or load a file from a disk location (**Load from...**).

To learn an E-MEM:

1. Open the Advanced view.
2. When the configuration is complete for all channels on the module, type a descriptive name for the configuration into an unused E-MEM register (or overwrite an existing one).
3. Learn the E-MEM to memory by selecting the corresponding **Learn** button. All channel configurations are learned at once and stored in the same register. This register is now learned and ready for recall.

File Operations

Save File

File operations allow you to save learned configurations to a computer hard drive or other accessible media for later recall to the onboard E-MEM registers of any Kameleon module in your system.

To save to a file, first make sure you have learned the configuration, then press the **Save To...** button.

This will bring up a File Download screen similar to [Figure 71](#). Select **Save**.

Figure 71. File Download Screen

This will bring up the Save As screen as shown in [Figure 72](#). Locate or create a directory for storing the E-MEMs and select **Save**. This E-MEM register is now saved to the selected location and may be recalled as described below.

Note For frames running 2000NET software version v3.2.2 and earlier, files will be saved with a .mcm extension. For later version 2000NET software, files will be saved as .bin. Either file type can be used with the later version software.

Figure 72. Save As Screen

Load File

A file may be loaded from a saved directory to a register on the E-MEM web page by selecting the **Load From...** button in the associated E-MEM register in the Advanced view. This will bring up the Load E-MEM web page ([Figure 73](#)).

Figure 73. Load E-MEM Web Page

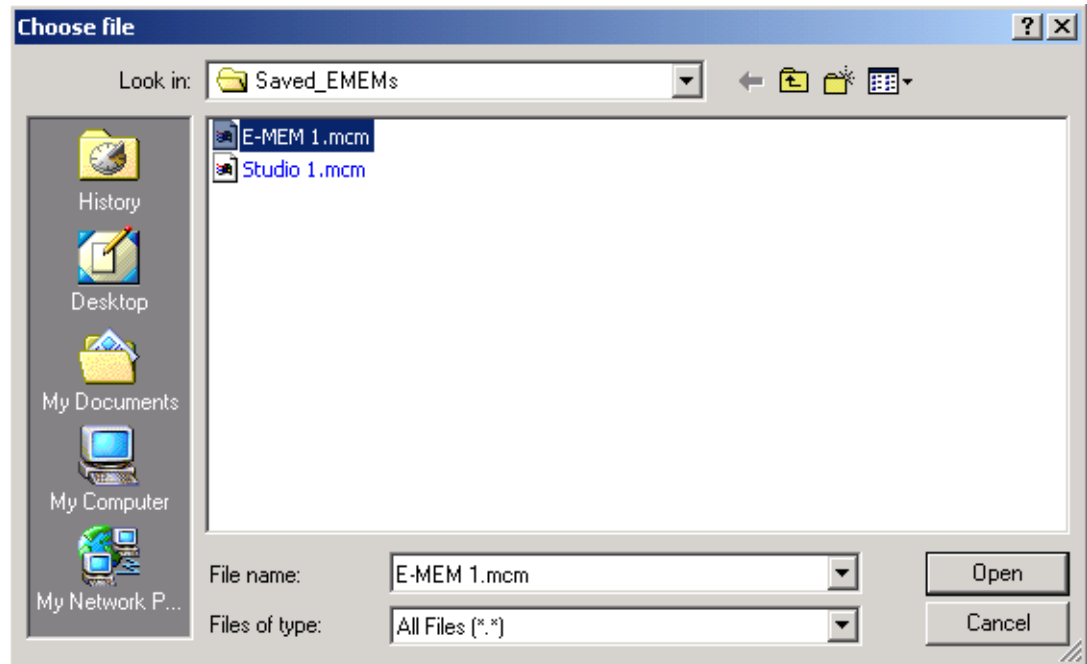

Model: [KAM-AV](#) Description: [Kameleon Module](#)
Frame Location: [Bay 1 QA 2000 Frame](#) , Slot: 2

Load file into E-MEM 1...

Enter filename:

Enter a path and filename or use the **Browse** button to locate your saved E-MEM files. Browse to the Choose File screen (Figure 74), select the E-MEM file to download and select **Open**.

Figure 74. Choose File Screen

This will place the path and filename in the Load E-MEM screen (Figure 73 on page 104). If this is the correct file, select **Load**. Continue to load files or select **Cancel** to return to the main E-MEM web page. Loaded files will now be entered in the associated E-MEM registers.

Select the associated **Recall** button for each E-MEM register to load the configuration to the module.

Slot Configuration Web Page

- [Audio Channel Pairing](#)
 - [Audio Sync](#)
 - [Audio Proc](#)
 - [Analog Audio Outputs](#)
 - [AES Outputs](#)
 - [E-MEM](#)
 - [Slot Config](#)
 - [Software Update](#)
- Use
this
link

Use the Slot Config web page (Figure 75 on page 107) to:

- Assign an appropriate name to the module slot,
- Assign an Asset Tag identification,
- Enable/disable the **Locate Module** function,
- Save module configuration and enable slot memory,
- Check SNMP related 2000NET module switch settings, and
- Enable/disable SNMP reporting for the specific Kameleon slot.

Slot Identification

You may identify the module by typing a specific name in the **Name** field. The assigned name is stored on the 2000NET module and travels with the 2000NET module if it is moved to another frame. Select **Default** to enter the factory default module name.

An asset identification may be entered in the **Asset Tag** field. This will appear on the module Status web page and in the NetConfig inventory report.

Locate Module

When enabled by selecting the **Flash** pulldown, the **Locate Module** function flashes the yellow COMM and CONF LEDs on the front of the module to make it easy to locate in the frame (see *Operation Indicator LEDs* on page 28).

Slot Memory

The slot configuration for each media module is automatically saved periodically to the 2000NET module in that frame. You may also select the **Learn Module Config** button at any time to save the current configuration for this slot. The configuration is saved on the 2000NET module. If the 2000NET module is removed or powered down, the stored configurations are not saved.

When the **Restore upon Install** box has been checked, the current configuration saved to this slot is saved as slot memory. When the current module is removed and another module of the same type is installed, the configuration saved to the 2000NET module will be downloaded to the new module. The box must be checked before the current module with the saved configuration is removed.

Trap Severity	Alarm	Warning	Warning	Warning

Frame Health Reporting

The reporting of Slot Fault, Signal Loss, and Reference Loss can be enabled or disabled to the Frame Health connector on the rear of the Kameleon frame (2000T3NG only) by selecting or deselecting the corresponding checkbox.

Hardware Switch Controls

This section is a read-only status report of 2000NET module switch settings for Module Status Reporting and Asynchronous Status Reporting. These functions must be enabled for the following Slot SNMP Trap Reports to function.

Slot SNMP Trap Reports

This section is displayed only when the SNMP Agent software has been installed on the 2000NET module (refer to the *2000NET Instruction Manual* for installation instructions). Slot SNMP traps can be enabled only when the hardware switches for Module Fault reporting and Asynchronous Status reporting are enabled on the 2000NET module (dipswitch S1 segment 7 and dipswitch S2 segment 1).

The enabled SNMP traps will be reported to any SNMP manager that is identified as an SNMP Report Destination in 2000NET configuration. Trap severity is read-only hard-coded information that is interpreted and responded to by the SNMP Manager software configuration.

Number of outputs	4 per submodule
Signal type	-2 dB to +24 dBu, adjustable in 0.1 dBu steps
Output impedance	100 Ω balanced
Drive capability maximum	+24 dBu balanced @ 10 K Ω load
Differential DC	0.25 V maximum
Connector type	Multi-pin (receptacle)

Table 17. Audio DAC Specifications - (continued)

Parameter	Value
Analog Audio Output Performance (48 kHz sampling rate)	
Signal/noise ratio	> 102 dB, 20 Hz to 20 kHz > 105 dB, "A" weighted
THD+noise, swept 20 Hz-20 kHz	< -75 dB, 20 Hz to 20 kHz, @ +24 dBu
Interchannel crosstalk	< -80 dB, 20 Hz to 20 kHz
Intermodulation distortion	< -80 dB CCIF two-tone test, 19 & 20 kHz tones
Interchannel gain mismatch	0.1 dB
Frequency response	± 0.2 dB, relative to 1 kHz, 20 Hz to 20 kHz @ +24 dBu
DC offset	± 50 mV
Output resolution	24 bits
Effective number of bits	18
Static withstand	5 kV (330 Ω, 150 pF) any input or output

Table 18. Frame Sync/Timing Specifications

Parameter	Value
Video Frame Sync Timing Control Parameters	
Delay adjustment (main)	0 to 1 frame in 37 ns steps
Additional delay, composite out	0 to 151 μs in 37 ns steps
Fine phase delay, composite out	0 to 37 ns in 100 steps
Additional delay, SDI out	0 to 151 μs in 37 ns steps

Table 19. Main Video Processing Specifications

Parameter	Value
Main Video Frame Processing Control Parameters	
Y gain	± 50% in 0.4% steps, 100% default
Y offset	± 3.5% of 100% white in 0.11% steps, 0% default
B-Y gain	± 50% in 0.4% steps, 100% default
B-Y offset	± 3.5% of 100% white in 0.11% steps, 0% default
R-Y gain	± 50% in 0.4% steps, 100% default
R-Y offset	± 3.5% of 100% white in 0.11% steps, 0% default
Color bars	on/off

Table 20. Multiplexing/Demultiplexing Specifications

Parameter	Value
MUX/DEMUX Performance	
Standard	SMPTE 272M A, C: Synchronous audio, 48K, 20/24 bits/sample Compatible with buffer sizes down to 48 samples
Pass through	Up to 4 groups (frame sync must be in delay mode)
Extract, retime, insert	Up to 2 groups
Delete	Up to 4 groups
Insert	Up to 2 groups
Bits/sample on inserted audio	20/24 bits, selectable
Buffer size	170 samples
DEMUX delay	1.77 ms
MUX delay	1.77 ms
Distribution	Evenly distributed, minimum of 3 samples per line, maximum of 4 samples per line except near switching lines Switch line and nearby lines (lines 4, 5, 6, 317, 318, 319 for 625; 8, 9, 10, 270, 271, 272 for 525) have 0 samples

Table 21. Audio Processing Specifications

Parameter	Value
Audio Processing	
Number of channels supported	8
Sample Rate Conversion	All audio inputs (analog, AES or DEMUX) retimed to output timing reference (either input video or frame reference)
Fixed Delay	0 – 5.2 sec in 20 ms steps, individual setting for each channel
Delay Tracking	Delay can be set to automatically track delay through video frame sync with fixed offset
Gain	+ 6 to -40dB in 0.1dB steps, individual setting for each channel.
Other processing	Selectable: Invert; L + R; L-R; -(L-R); 1 kHz; 400 Hz; Silence Individual setting for each channel.
Re-pairing	Complete flexibility to swap or recombine any input channel with any other

Table 22. Electrical Length Specifications

Parameter	Value
Electrical Length	
Composite In to Composite Out	2 lines + 10 μ s
Composite In to SDI Out	1 line + 10 μ s
SDI In to Composite Out	1 line + 16 μ s
SDI In to SDI Out	14 μ s
SDI In to AES/EBU Out (DMUX)	3.8 ms
SDI In to Analog Audio Out (DMUX)	4.5 ms

Table 22. Electrical Length Specifications - (continued)

Parameter	Value
Analog Audio to Analog Audio	1.9 ms
Analog Audio to AES/EBU	1.2 ms
Analog Audio to SDI Out (MUX)	3.0 ms
AES/EBU to Analog Audio	2.5 ms @ 48 kHz
AES/EBU to AES/EBU	2.0 ms @ 48 kHz
AES/EBU to SDI Out (MUX)	3.8 ms @ 48 kHz
SDI In to SDI Out Audio Delay (DMUX, retime, MUX)	5.6 ms

Table 23. Environmental/Power Specifications

Parameter	Value
Environmental	
Frame temperature range	See Kameleon Frame Manual
Operating humidity range	0 to 90% non-condensing
Non-operating temperature	-10 to +70 degrees C
Mechanical	
Frame type	2000T1DNG Kameleon Frame or 2000T3NG Kameleon Frame
Power	
Consumption	KAM-AV – 14 Watts typical KAM-SD – 11 Watts typical KAM-ADC-S – 2 Watts typical KAM-DAC-S – 2 Watts typical

Service

The Kameleon modules make extensive use of surface-mount technology and programmed parts to achieve compact size and adherence to demanding technical specifications. Circuit modules should not be serviced in the field except to check and replace fuses.

Troubleshooting

If your module is not operating correctly, proceed as follows:

- Check frame and module power. If power is not present, check the fuse on the +24 V input to the module as illustrated in [Figure 77](#).
- Check for presence and quality of input signals.
- Verify that source equipment is operating correctly.
- Check cable connections.

Figure 77. Location of Module Fuse

Refer to [Figure 14 on page 27](#) for the location of PWR LED and [Table 7 on page 28](#) for proper LED indications.

If the module is still not operating correctly, replace it with a known good spare and return the faulty module to a designated Thomson Grass Valley repair depot. Call your Thomson Grass Valley representative for depot location. Refer to [Contacting Grass Valley](#) at the front of this document for the Grass Valley Customer Support Information number.
