Welcome to LVS

We are pleased to present Version 3.1 of the Profile LVS Event Management System software for use with the Profile LVS Live Controller.

The LVS Event Management System software is available in two versions:

- Basic Feature Set, included with the Profile LVS Live Controller.

- Enhanced Feature Set (LVS ESW), available as an option.

The *Profile LVS Event Management System Instruction Manual* (070-9794-03) describes both of these feature sets.

These *Release Notes* detail the changes and new features in Version 3.1, and provide up-to-the-minute information about the Profile LVS Live Controller and the Enhanced Feature set *only*. Please consult the LVS Basic Feature Set Release Notes for the latest information about the basic software.

This software was thoroughly tested before release. However, you may encounter some operational limitations or have suggestions on how to improve the product. Please contact Tektronix Product Support if you have any problems or comments.

System Requirements

The LVS 3.1 Enhanced Feature Set software operates on all Profile systems, including PDR 100 (with EDR boards), PDR 200, and PDR 300.

> *NOTE: The LVS Event Management System uses JPEG codecs only. You cannot allocate MPEG or DVCPRO25 resources to LVS operations.*

The following table summarizes the minimum and recommended software versions to ensure optimum LVS Event Management System operation. Contact Tektronix Support if you do not have the required software version.

Table 1. LVS ESW Software Compatibility

Software	Minimum	Recommended
Profile System Software	2.5.1.21	2.5.1.21
Live Controller Firmware	1.20	2.0

Installing the Software

Install the software as described in the *Profile LVS Event Management System Instruction Manual.* Log in as *administrator* to install the software. Please read the following notes before installing the software.

Before You Upgrade

The LVS ESW 3.1 upgrade requires a new LVS Software Authorization file, as described in "The LVS Software Authorization File" on page 6. Since the new file will replace your current authorization file on your system disk, you should create a copy of the current file to ensure that you can always re-install your current version of LVS ESW software.

Follow these instructions to archive your current LVS Software Authorization file:

1. Turn on the Profile system. Logon as Administrator
   User Name: **administrator**
   Password: **triton**

2. Copy your current LVS Software Authorization file (*c:\sports\xxxxxxx.key*) to a floppy disk using **Windows NT Explorer** or **My Computer**.

3. Label the diskette with the Profile system serial number and the LVS ESW version number which you are upgrading from. For example, you might label your diskette *LVS 2.2E Software Authorization -- B0201983*.

You can now install your current LVS software, as described in the following section.

Installing LVS ESW

Follow these instructions to install LVS ESW Enhanced software for the first time, or as an upgrade to a previous version.

1. Install Profile System Software Version 2.5.1.21 or higher. Refer to the Release Notes that accompany the software for installation instructions.

   NOTE: You must restart your Profile system after installing Profile System Software and before installing the LVS ESW software.

2. If you are upgrading from a previous version of LVS ESW software, follow the instructions in the *Profile LVS Event Management System Instruction Manual* to remove that older version.

3. Install only the LVS ESW Enhanced software *only* using the instructions in the *Profile LVS Event Management System Instruction Manual*

   NOTE: If you're installing the LVS ESW Enhanced software, you don't need to install the LVS Basic software first.

4. Your newly-installed LVS ESW software will operate for a total of about 10,000 minutes (the equivalent of about 7 days, 24 hours a day) without an authorization file.

   To enable the LVS ESW software for unlimited use on a single Profile Video Disk Recorder, you must obtain an LVS Software Authorization file as described in the next section.

The LVS Software Authorization File

Your newly-installed LVS ESW software will operate for a total of about 10,000 minutes (the equivalent of about 7 days, 24 hours a day) without an authorization file.

NOTE: The LVS Basic Software does not require a software authorization file.

To enable the LVS ESW software for unlimited use on a single Profile Video Disk Recorder, you must obtain and use an LVS Software Authorization file.

Obtaining an LVS Software Authorization File

To obtain your LVS Software Authorization file as quickly as possible, complete the enclosed Profile LVS Software Authorization Request form, then e-mail the information **and** fax your request to Tektronix VND Scheduling at the e-mail address and fax number listed on the form.

If you're unable to send or receive e-mail, you can send your completed form by fax only. You'll receive an LVS Software Authorization diskette within five to seven business days.

Using Your LVS Software Authorization File

When you receive the LVS Software Authorization file by e-mail, you must do the following:

1. Save the LVS Software Authorization information to a file in the *c:\sports* directory. Use the following file name:

    xxxxxxx.lvs, where *xxxxxxx* is the Profile serial number.

    NOTE: You must use the LVS Software Authorization file for the Profile Video Disk Recorder bearing the serial number you entered on the request form.

2. Create an LVS Software Authorization diskette, labeled with the Profile serial number, and copy the ***xxxxxxx.lvs*** file to the diskette as a backup.

3. Follow the instructions in the *Profile LVS Event Management System Instruction Manual* to register the key.

    NOTE: If you received your LVS Software Authorization file on a diskette, copy the xxxxxxx.lvs file from the diskette to the c:\sports directory, then register the key as described in the **Profile LVS Event Management System Instruction Manual.**

New Features in Version 3.1

The following new features have been implemented in Version 3.1 of the LVS Enhanced Feature Set software.

Read/Write PDRMovie Capability

This version of LVS ESW software allows you to use material that you create in an LVS session with other Profile applications. For example, you can now save a highlights on a digital data tape by using Media Manager to save your clips on a PLS 20. You can then read the tape on a Profile system at another location. This release allows you to read and write simple clips and masters (complex movies).

You can also use material created in other Profile applications in your LVS sessions. You can use Media Manager to copy the material to and from your LVS system over a Fibre Channel connection.

The new PDR Movie Display tab in the Library Window gives you all these capabilities by dragging and dropping material between your LVS session and other Profile applications.

If you wish to perform Fibre Channel transfers while you are still recording in the LVS session, be sure to select Protected Copy Movie on the Other tab of the Configuration window. This will protect you from possibly recording black during your Fibre Channel transfers.

Improved Jog/Shuttle Knob Response

Version 3.1 provides customizable Jog/Shuttle knob response times so that you can adjust the LVS Live Controller speed to your personal preference. To benefit from this improved performance, your LVS Live Controller must be running Firmware version 2.0.

All new LVS Live Controllers are now shipped with Firmware version 2.0. If you wish to upgrade your Live Controller to benefit from the improved Jog/Shuttle knob response, contact your sales representative and ask about the LVS Live Controller Firmware upgrade kit, part number 050-3420-XX.

Voice-overs

Version 3.1 allows you to record audio tracks that will play out with your existing material without re-recording the video. Use the Voice button in the Timeline window to add audio tracks to your existing pieces.

Internal Audio Cross-fades

If your Profile system is equipped with the ASPB audio board (standard in PDR 200 and PDR 300), you can now create audio cross-fades to go along with your video transitions without any external mixing.

Scrub Audio

During shuttle operations, your audio will sound more like analog tape audio when you enable the new scrub audio feature in Profile System Software. Look for this selection in the System Audio Configuration dialog box which opens when you choose **Options | Audio Configuration** in Configuration Manager. Please note that scrub audio is not used on clips set to play at speeds other than normal (1.0).

Gang-roll Playback

You can now lock the operation of two LVS channels together, so that you can play back two clips perfectly in sync. You'll find this new capability in the Playlist Window.

Playback Speed Display

Scenes placed in the Playlist Window now show their speed setting directly in the window, so you don't have to display their properties in the Scene Window, for example.

Persistent Window Configurations

On shutdown, you can now choose to retain your window configurations, so that the column sizes and positions are restored the next time you start your LVS software.

Dynamic Configuration Changes

Configuration settings such as pre-roll and post roll, audio monitoring, maximum shuttle speed, and several others can now be changed without restarting the LVS software. You still have to restart the software for fundamental configuration changes such as codec assignments.

Preview Resource Locking

By locking the resources used by the Preview Window, you can avoid inadvertently using on-air resources for preview operations.

Disk Cleanup Cancel

This may help you preserve material that you didn't intend to remove.

Additional Mix Effects

If your Profile system is equipped with an optional Mix Effect board, you can now add one of seventeen transitions to your Playlists. Please refer to "Playlist Window with Mix/Effect (Option)" in the *Profile LVS Event Management System Instruction Manual* for more information on adding mix/effects to your playlists.

Table 2 lists the mix/effects that are supported by this release:

Table 2: LVS ESW Mix/effects

Effect Name	Description
Dissolve	Simple dissolve
HWipe	Horizontal wipe
VWipe	Vertical wipe
CenterHWipe	Horizontal barn door or curtain
CenterVWipe	Vertical barn door or curtain
BoxWipe	Centered 4 by 3 rectangular box
SquareWipe	Centered square box
CrossWipe	Centered 4 by 3 cross
DiagonalWipe	Diagonal wipe

Table 2: LVS ESW Mix/effects

Effect Name	Description
DiamondWipe	4 by 3 diamond
HourglassWipe	Hourglass shape (double vee)
VeeLeftWipe	Vee or arrow pointing left
VeeRightWipe	Vee or arrow pointing right
VeeUpWipe	Vee or arrow pointing up
VeeDownWipe	Vee or arrow pointing down
CircleWipe	Centered circle
EllipseWipe	Centered 4 by 3 ellipse

Shorter Events for Mix Effects

You may now create Mix Effects for events as short as 15 frames. This replaces the previous minimum duration of 60 frames.

LVS Software and Other Applications

You should avoid using other Profile applications such as VdrPanel at the same time as LVS software is running. This will prevent resource conflicts which may cause performance problems. You may want to remove VdrPanel from the Startup group or from the *pdrstart.bat file*.

Setup Limitations

The LVS **Setup | Normal** command doesn't check for configurations which are not supported by your Profile Video Disk Recorder. You must ensure that your system has the capabilities you select in the Setup dialog box.

If you create a configuration which is not supported by your system, clicking OK will result in a progress bar which remains on the screen indefinitely. You must use the Windows NT Task List (Ctrl+Esc) to end the task and remove the progress bar. You must then restart the LVS software and establish a valid configuration.

Known Problems

Problem	Selected scenes to be converted to PDR Movies are not added to a Library or Highlight window when you push the Entry button.
Workaround	You must open a Library or Highlight window before pressing the Entry button to add the scenes to the window.
Problem	With Protected Copy Movie enabled, creating PDR Movies fails. The PDR Movie is not created, and there is no error message.
Workaround	Shut down the LVS ESW software and restart your Profile system. All subsequent PDR Movie creation will succeed.
Problem	Occasionally, you may be unable to make space available by running Disk Cleanup.
Workaround	Move all the scenes and highlights that you wish to keep to the Library Window. Then shut down and restrart your LVS session. When prompted, delete scenes and highlights from previous sessions. This will free up all available disk space.
Problem	The software incorrectly reports no more disk space available, even though you have recorded less than the total available time.
Workaround	Avoid crossing the 24-hour boundary in an LVS session by always exiting the LVS software when it is not in use. If you must exceed 24 hours of continuous operation, refer to the "Starting Operation" section in Chapter 3 of the *Instruction Manual*.
Problem	PDR Movies appear to be correctly stored on PLS 20 tapes, but create zero-length clips when they are restored.
Workaround	If you wish to archive PDR Movies to a PLS20 data tape drive, use Media Manager to transcode the clips from JPEG to JPEG **before** transferring the clips to the tape.
Problem	Playlist clip names are changed to the Highlight name if you drag the highlight into the PDR Movie Display tab, then drag the highlight back into the Playlist window.

Workaround	There is no workaround for this problem.
Problem	While performing a Fibre Channel transfer of a clip with Media Manager, the resource assigned to the window from which the clip is being transferred plays and records black while the transfer is occurring.
Workaround	Enable the Protected Copy Movie option in the Other tab of the Configuration Window before creating your PDR Movies. This will create a duplicate of your material, which you can then transfer without affecting your LVS recordings.
Problem	In Slave Mode, changing either Playlist causes the Slave playlist to cue to the end of its last clip and not respond to further commands.
Workaround	Avoid making changes to Playlists while in Slave mode. If you need to change a Playlist, disable Slave mode first, make your changes, then enable Slave mode again.
Problem	Timecode search functions don't work correctly on the first clip in Extra Channel mode.
Workaround	Create a short Scene 1 that isn't required by your project, such as black or color bars. Timecode search functions will then operate correctly on the first real scene in your project, and on all subsequent scenes.
Problem	Effect duration cannot be set to match the event duration.
Workaround	Effects must be at least two seconds shorter than the event on which they are set. This time is required to correctly program the effect.
Problem	Auto Cue and Auto Play do not cue the highlighted clip in the Library's List Display mode.
Workaround	Auto Cue and Auto Play cue the clip which is highlighted in Page Display mode, even if a different clip is highlighted in the Library's List Display. Select Page Display mode to highlight a clip before using Auto Cue or Auto Play.

Problem	The Playlist video output may not show the correct cue point after a trim operation in the Scene Information Window.
Workaround	Manually recue the event after trimming it in the Scene Information Window.
Problem	Individual fader presets are not retained when the faders are grouped; the faders reset to matching levels.
Workaround	Grouped fader controls operate with matching fader levels only. Individual settings are not supported.
Problem	Packaged playlists and timelines placed in the Highlight packages and Library lists cannot be trimmed or edited in the Scene Information Window or the Preview Window.
Workaround	Bring the saved Highlight package or Library list back into the Highlight or Library Window respectively, then trim or edit the playlist or timeline there.
Problem	Playback of a Playlist stops or doesn't play as expected when the Playlist is changed from the Scene Information Window.
Workaround	Allow at least five seconds between a change to a Playlist event and the time the event will be played out.
Problem	On some systems, changing from Step to Continuous playback in Playlist mode causes the playback to stop.
Workaround	Restart the playback. Avoid switching from Step to Continuous on air.
Problem	The documented Import Frame command in the Preview Window is not available.
Workaround	This function is not supported in this release.

Problem	After a change to the system configuration, all scenes and highlights not stored in the Library are automatically deleted when the LVS application is restarted.
Workaround	Be sure to save all the scenes and highlights that you wish to retain in the Library before shutting down the LVS application to reconfigure the system. Note that this deletion only occurs if:

  • The Configuration Window settings are cleared and then re-entered.

  • A configuration is loaded from disk, even if it is identical to the current configuration.

  • Any changes are made to the first Configuration Window tab (Resource Assign).

Changes made to the Resource Setup, Video Routing, Timecode Routing, and Other tabs allow you the choice of saving or deleting scenes and highlights.

Problem	Several highlights can be saved with the same name.
Workaround	Use the HP number to distinguish between different highlights with the same name. The HP number is unique for each highlight.
Problem	The LVS ESW software does not start, or displays a Time Remaining message when you close the application, even though you installed an LVS Software Authorization file.
Workaround	The LvsRgKey application does not check the validity of the key code or key file you use. A message box confirming that you entered a key code always appears, whether or not the key code is valid on that machine. You must ensure that you use a key code that matches the serial number of the Profile system on which you are installing the key.
